FOREWORD

The Software Engineering Laboratory (SEL) is an organization sponsored by the National Aeronautics and Space Administration Goddard Space Flight Center (NASA/GSFC) and created for the purpose of investigating the effectiveness of software engineering technologies when applied to the development of applications software. The SEL was created in 1977 and has three primary organizational members:

NASA/GSFC (Systems Development and Analysis Branch)
The University of Maryland (Computer Sciences Department)
Computer Sciences Corporation (PCASS Project)

The goals of the SEL are (1) to understand the software development process in the GSFC environment; (2) to measure the effect of various methodologies, tools, and models on this process; and (3) to identify and then to apply successful development practices. The activities, findings, and recommendations of the SEL are recorded in the Software Engineering Laboratory Series, a continuing series of reports that includes this document. A version of this document was also issued as Computer Sciences Corporation document CSC/SD-83/6012.

The primary contributors to this document include

Pei-Shen Lo (Computer Sciences Corporation)
David Wyckoff (Computer Sciences Corporation)

Other contributors include

Jerry Page (Computer Sciences Corporation)
Frank McGarry (Goddard Space Flight Center)

Single copies of this document can be obtained by writing to

ABSTRACT

This document provides a description of the structure of the Software Engineering Laboratory (SEL) data base. It defines each data base file in detail and provides information about how to access and use the data for programmers and other users. Several data base reporting programs are described also.

Bibliography of SEL Literature

SECTION 1 - INTRODUCTION

The Software Engineering Laboratory (SEL) was created to support efforts to measure and evaluate the effects of various methodologies, models, and tools on the software development process. The SEL is a combined effort involving Goddard Space Flight Center (GSFC), Computer Sciences Corporation (CSC), and the University of Maryland (UM).

One of the major functions of the SEL is the collection, analysis, and archiving of detailed data, describing all facets of the software development process within the Systems Development Section of GSFC. The projects providing the detailed data are software development efforts in support of GSFC flight dynamics ground support systems.

To facilitate the use of the information collected, a data base was designed that consists of approximately 330 indexed files on a DEC PDP-11/70 computer. In addition to several header or summary files, each project studied may require up to 11 files--one for each of the 7 types of forms collected and 4 general information files. Section 2 of this document describes the structure of the data base. The software packages that support the entry, maintenance, reporting, retrieving, and backup of this data base are described in Section 3.

SECTION 2 - DATA BASE ORGANIZATION

This section describes the structure and content of the SEL data base files. Many of the files are organized in response to the structure of the SEL forms. In general, the files are organized by project and by form type. Exceptions and additions are noted in the following subsections.

The following is a list of the data base files in the order in which they are described in Section 2.2 and in Appendix A ("proj" is the project name; "n" is the number of projects in the data base):

| <u>Descriptive File Name</u> | <u>Number of Files</u> | <u>File Name</u> |
|--|--------------------------------|--|
| Encoding Dictionary File | 1 | ENCODE.HDR |
| Estimated Statistics File | 1 | EST.HDR |
| File Name and Status File | 1 | STAT.HDR |
| Phase Dates File | 1 | HEADER.HDR |
| Subjective Evaluations Directory File | 1 | DIR.HDR |
| Subjective Evaluations File | 1 | SEF.HDR |
| Attitude Maintenance Change Report (ATM) File | n | proj1.ATM,proj2.ATM, ...,projn.ATM |
| Change Report Form (CRF) File | n | proj1.CRF,proj2.CRF, ...,projn.CRF |
| Component Status Report (CSR) File | n | proj1.CSR,proj2.CSR, ...,projn.CSR |
| Component Summary Form (CSF) File | n | proj1.CSF, proj2.CSF, ...,projn.CSF |
| General Project Summary (GPS) File | n | proj1.GPS,proj2.GPS, ...,projn.GPS |
| Resource Summary Form (RSF) File | n | proj1.RSF,proj2.RSF, ...,projn.RSF |

| Transaction (backup) Files | 7 | TRANS.CIF, TRANS.CRF, TRANS.CSR, TRANS.CSF, TRANS.HIS, TRANS.RSF, TRANS.RAF |

2.1 FILE ATTRIBUTES

All data base files, except the transaction files, are located on disk DB1, under user identification code (UIC) [204,1]. The name of a file is composed by attaching the project name and form type abbreviation to the disk and UIC designation. For example, to access change report data for project PROJ, the name would be DB1:[204,1]PROJ.CRF.

The transaction files are on disk DB0 to allow data base restoration in the case of a failure of disk DB1.

The larger projects have up to 2,000 forms and up to 10,000 records. A project this large would take up about 4000 500-byte blocks. The total data base takes up approximately 49,000 blocks.

2.2 FILE DESCRIPTIONS

On this data base, there are three file types or categories:

- Header or summary files
- Form data files
- Auxiliary files

Header or summary files contain directory and summary information (such as total lines of source code, project duration, and total effort) for each project.

Form data files correspond directly to a particular type of form; there is a separate file for each form type per project.

Auxiliary files contain support information, such as descriptive text (Comment Files), taken from the software engineering forms and component descriptions generated by SAP (Reference 1) ..

Except as noted, all files are indexed. Appendix A describes all file formats in detail, including every field in each record type.

2.2.1 HEADER (SUMMARY) FILES

The header or summary files contain directory and summary information for the entire data base. These files can be used to obtain top-level summary reports on all the data. The following six header files are described in this section:

- Encoding Dictionary
- Estimated Statistics
- File Name and Status
- Phase Dates
- Subjective Evaluations
- Subjective Evaluations Directory

2.2.1.1 Encoding Dictionary File (ENCODE.HDR)

The Encoding Dictionary File contains the numerical code type information used to represent the lengthier alphanumeric or English text information. The codes are used to save space where certain titles, names, or other pieces of information are used repetitively throughout the data base. Twenty-four different types of codes are represented on the file. (Some types may require more than one record of data.) Typical pieces of data that are coded and placed on this dictionary are project name, programmer name, source language, types of changes, and types of error. Thus, since project names, for example, are used repetitively throughout the data base, the corresponding numerical codes are used instead of the full name. The codes are assigned by the data base administrator and do not have any particular significance as far as priority or importance are concerned. The Encoding Dictionary File contains the following fields:

- Code type
- Code
- Abbreviated name
- Full English description

Below are three sample records:¹

| <u>Type</u> | <u>Code</u> | <u>Abbreviation</u> | <u>Description</u> |
|-------------|-------------|---------------------|--------------------|
| 4 | 1 | UNITT | Unit test |
| 4 | 2 | SYSTEMT | System test |
| 4 | 3 | BNCHMRKT | Benchmark test |

See Appendix A, Section A.1, for the file format.

¹Throughout Section 2, each of the records is to be read across. For example, on page 2-7, the first or Project 1 record contains a code of 10, 638 components, 535 modules, and so on.

2.2.1.2 Estimated Statistics File (EST.HDR)

The Estimated Statistics File characterizes the size and resources (manpower, computer) of each project. The file contains a single record of information for each project on the data base. Each record contains a project name as well as information summarizing the characteristics of that project. This information is usually collected at the conclusion of a project by personnel close to the project. It summarizes the basic size and resource characteristics of each project. The project managers review the completed project and gather the following information for this file:

- Project name
- Number of components and modules
- Number of lines, executable statements, runs, and changes
- Number of pages of documentation
- Programmer, management, and services hours
- IBM S/360-95 and -75 hours (based on computer accounting information)
- Other computer hours

Below are three sample records--one for Project 1, one for Project 2, and one for Project 3--in the Estimated Statistics File. The programmer, management, and services hours are stored as integer type characters formed from the real number values times 10. The status flag¹ refers to the status of the data: 1 is unchecked data, 2 is hand-checked data, and 3 is data verified by application.

¹This is true for all sample records throughout Section 2.

| <u>Project Name</u> | <u>Project Code</u> | <u>Number of Components</u> | <u>Total Number of Modules</u> | <u>Number of New Modules</u> |
|---------------------|---------------------|-----------------------------|--------------------------------|------------------------------|
| PROJ1 | 10 | 638 | 535 | 337 |
| PROJ2 | 38 | 113 | 102 | 93 |
| PROJ3 | 19 | 639 | 519 | 418 |

| <u>Number of Modified Modules</u> | <u>Number of Runs</u> | <u>Number of Changes</u> | <u>Pages of Document</u> | <u>Total Number of Lines</u> |
|-----------------------------------|-----------------------|--------------------------|--------------------------|------------------------------|
| 31 | 7500 | 1576 | 1793 | 75,393 |
| 0 | 1589 | 255 | 763 | 15,258 |
| 59 | 1000 | 2350 | 2458 | 85,369 |

| <u>Number of New Lines</u> | <u>Number of Modified Lines</u> | <u>Number of Total Exec Statements</u> | <u>Number of New Exec Statements</u> | <u>Number of Modified Exec Statements</u> |
|----------------------------|---------------------------------|--|--------------------------------------|---|
| 49,316 | 4252 | 30,448 | 59,098 | 1179 |
| 14,873 | 0 | 4,482 | 4,413 | 0 |
| 76,883 | 5652 | 38,157 | 35,203 | 2161 |

| <u>Programmer Hours</u> | <u>Management Hours</u> | <u>Services Hours</u> | <u>S/360-95 Computer Hours</u> |
|-------------------------|-------------------------|-----------------------|--------------------------------|
| 109,565 | 35,510 | 12,310 | 2090 |
| 31,638 | 13,022 | 11,942 | 628 |
| 116,586 | 27,119 | 27,444 | 3120 |

| <u>S/360-75 Computer Hours</u> | <u>Other Computer Hours</u> | <u>Status Flag</u> | <u>Active Flag</u> | <u>Project Category</u> |
|--------------------------------|-----------------------------|--------------------|--------------------|-------------------------|
| 1930 | 0 | 1 | N | 1 |
| 4 | 0 | 1 | N | 1 |
| 1852 | 0 | 1 | N | 1 |

See Appendix A, Section A.2, for the file format.

2.2.1.3 File Name and Status File (STAT.HDR)

The File Name and Status File is a type of summary directory for the entire data base. It contains one record for each indexed file in the data base. Each record contains a file name; creation, last backup, and last access dates (YYMMDD format); and number of records in the particular file. These data are updated automatically by the data entry program (Data Base Maintenance Software (DBAM) (Reference 2)) whenever a file is accessed.

Three sample File Name and Status File records are given below--one for Project 1, one for Project 2, and one for Project 3:

| <u>Project Name</u> | <u>Project Code</u> | <u>File Name</u> | <u>Creation Date</u> |
|---------------------|---------------------|--------------------------|-------------------------|
| PROJ1 | 10 | DB1:[204,1]PROJ1.RSF | 790312 |
| PROJ2 | 38 | DB1:[204,1]PROJ2.RSF | 791026 |
| PROJ3 | 19 | DB1:[204,1]PROJ3.RSF | 790901 |
| | | <u>Last Backup Date</u> | <u>Last Update Date</u> |
| | | 820611 | 790312 |
| | | 820611 | 0 |
| | | 820611 | 0 |
| | | <u>Number of Records</u> | |
| | | 91 | |
| | | 93 | |
| | | 162 | |

See Appendix A, Section A.3, for the file format.

2.2.1.4 Phase Dates File (HEADER.HDR)

The Phase Dates File contains the start and end dates for all phases in the software development cycle. The file includes project name, code, and the dates (YYMMDD format) for the requirements, design, code and unit test, system test, acceptance test, cleanup, and maintenance phases for each project. These dates are obtained from the project manager at the conclusion of each project.

Below are three sample Phase Dates File records--one for Project 4, one for Project 2, and one for Project 3:

| <u>Project Name</u> | <u>Project Code</u> | <u>Development Computer</u> | <u>Target Computer</u> | <u>Alien Computer Use</u> |
|---------------------|---------------------|-----------------------------|------------------------|---------------------------|
| PROJ4 | 2 | 0 | 0 | 0 |
| PROJ2 | 10 | 0 | 0 | 0 |
| PROJ3 | 19 | 0 | 0 | 0 |

| <u>Req. Start</u> | <u>Req. End</u> | <u>Design Start</u> | <u>Design End</u> | <u>Code and Test Start</u> |
|-------------------|-----------------|---------------------|-------------------|----------------------------|
| 761010 | 770213 | 770213 | 770604 | 770604 |
| 770101 | 770401 | 770401 | 770730 | 770730 |
| 780101 | 780501 | 780501 | 781014 | 781014 |

| <u>Code and Test End</u> | <u>System Test Start</u> | <u>System Test End</u> | <u>Acceptance Test Start</u> | <u>Acceptance Test End</u> |
|--------------------------|--------------------------|------------------------|------------------------------|----------------------------|
| 771203 | 771203 | 780204 | 780204 | 780318 |
| 780114 | 780114 | 780218 | 780218 | 780415 |
| 790331 | 790331 | 790602 | 790602 | 791013 |

| <u>Cleanup Start</u> | <u>Cleanup End</u> | <u>Maintenance Start</u> | <u>Maintenance End</u> | <u>Status Flag</u> |
|----------------------|--------------------|--------------------------|------------------------|--------------------|
| 780318 | 780427 | 780429 | 780820 | 1 |
| 780415 | 780624 | 780624 | 781024 | 1 |
| 791013 | 791222 | 791222 | 800404 | 1 |

See Appendix A, Section A.4, for the file format.

2.2.1.5 Subjective Evaluations File (SEF.HDR)

The Subjective Evaluations File characterizes the development methods and environment of each project. New information is added to this file near the conclusion of each project. By reviewing code and documents and by observing the development process, project managers quantify the degree to which each of the qualities applies to the project. This is strictly a subjective management evaluation.

The data for each project are contained in seven variable-length records. Each record represents a main category of measures. The seven categories are

- Software Engineering (SE)--Includes practices and techniques (MT), tools (TS), and documentation (DC) measures
- Development Team Ability (AB)--Includes experience with application (AP), effectiveness of management (MG), and performance of team (PF) measures
- Difficulty of Project (DF)--Includes complexity of problem (CP), internal influences on project (IN), and external influences on project (EX) measures
- Process and Product Characteristics (PC)--Includes resources available (RA), software product (PR), and product/process performance (PP) measures
- Development Team Background (DB)--Includes team rank (RK), years of professional experience (YP), years of applicable experience (YA), and years of environment experience (YE) measures
- Models (MD)--Includes Walston-Felix model (WF), PRICE S3 model (PS), and COCOMO model (CO) measures
- Additional Details (AD)--Includes miscellaneous (MS) and code breakdown (SW) measures

See Appendix A, Section A.5, for the file format. Sample records are not presented here because of their extreme length. Reference 3 describes the data collected for this file.

2.2.1.6 Subjective Evaluations Directory File (DIR.HDR)

The Subjective Evaluations Directory File contains the alphanumeric code type information used to represent the lengthier English text information. The codes represent

certain titles, names, or other pieces of information describing measures used in the Subjective Evaluations File. Each record contains information for one specified measure in the Subjective Evaluations File. The Subjective Evaluations Directory File contains the following fields:

- Code for the measure
- Name of the measure
- Minimum value of the measure
- Maximum value of the measure
- Data record sequence number (1 through 7)
- Byte location in the data record
- Textual description of the measure

The following are three sample records:

| <u>Code</u> | <u>Name</u> | <u>Minimum Value</u> | <u>Maximum Value</u> | <u>Record Number</u> | <u>Byte Location</u> | <u>Description</u> |
|-------------|-------------|----------------------|----------------------|----------------------|----------------------|------------------------------|
| AP01 | EXPERT1 | 0 | 50 | 2 | 6 | Expert 1 |
| MT20 | CCONFIG | 0 | 50 | 1 | 44 | Code (configuration control) |
| SW61 | SCHANGEN | 0 | 9000 | 7 | 472 | Software Changes (new) |

See Appendix A, Section A.6, for the file format.

2.2.2 FORM DATA FILES

These files correspond in number and in content to the information collected on the software engineering forms. There is one file for each form type per project. There are seven form data files, which are described in detail in the following subsections:

1. Attitude Maintenance Change Report (ATM) File
2. Change Report Form (CRF) File
3. Component Status Report (CSR) File
4. Component Summary Form (CSF) File

5. General Project Summary (GPS) File
6. Resource Summary Form (RSF) File
7. Run Analysis Form (RAF) File

2.2.2.1 Attitude Maintenance Change Report (ATM) File

The Attitude Maintenance Change Report File contains information on changes made to a program during the maintenance and operation phase of the project (after the project delivery date). The ATM form is filled out by maintenance personnel. Although this file contains essentially the same information provided on the Change Report Form, there are some slight differences. The following information can be found on the ATM File:

- Programmer
- Number of components changed
- Date on which change was determined
- Date on which change was started
- Type of change
- Primary error type
- Types of error detection activities
- Time spent implementing change

See Appendix A, Section A.7, for the file format.

2.2.2.2 Change Report Form (CRF) File

The Change Report Form File contains information on changes made by a programmer after the source has been added to the permanent library. The CRF is filled out by the programmer. Each form describes one error or change. One record on the CRF File represents one form and contains the following:

- Programmer
- Form date
- Number of components changed
- Number of components examined

- Date on which change was determined
- Date on which change started
- Amount of time/effort required for change
- Type of change
- Type of error (if error)
- When error entered system
- Activities used to isolate error
- Time required to isolate error
- Whether or not a workaround was used
- Whether or not change was related to a previous change

Below are three sample records on the CRF File. Hyphens indicate blanks.

| <u>Form Number</u> | <u>Project</u> | <u>Programmer</u> | <u>Form Date</u> | <u>Number of Components Changed</u> |
|--------------------|----------------|-------------------|------------------|-------------------------------------|
| K00016 | 19 | 26543 | 790103 | 9 |
| K00017 | 19 | 14336 | 781026 | 1 |
| K00018 | 19 | 14336 | 781026 | 1 |

| <u>Number of Components Examined</u> | <u>More Than One Comp Affected</u> | <u>Date Change Was Determined</u> | <u>Date Change Was Started</u> | <u>Effort for Change</u> |
|--------------------------------------|------------------------------------|-----------------------------------|--------------------------------|--------------------------|
| 11 | Y | 790102 | 790102 | 2 |
| 1 | - | 781026 | 781026 | 2 |
| 1 | - | 781026 | 781026 | 1 |

| <u>Type of Change</u> <u>1 2 3 4</u> | <u>Changed Components</u> <u>1 2 3 4 5</u> | <u>Type of Error</u> <u>1 2 3 4</u> | <u>When Error Entered System</u> |
|---|---|--|----------------------------------|
| 1 4 - - | 443 386 907 881 252 | 3 - - - | 3 |
| 1 - - - | 695 - - - - | 7 - - - | - |
| 1 - - - | 152 - - - - | 7 8 - - | 4 |

| <u>Data Structure Error</u> | <u>Control Logic Error</u> |
|-------------------------------------|------------------------------------|
| X | - |
| - | - |
| - | X |

The following fields describe activities used to isolate errors.

| <u>For Program Validation</u> 1 2 3 4 5 | <u>For Detecting Symptoms</u> 1 2 3 4 5 | <u>Tried in Finding Cause</u> 1 2 3 4 5 | <u>For Finding Cause</u> 1 2 3 4 5 |
|--|--|--|---|
| 1 4 - - - | 1 4 - - - | 5 6 B - - | 5 6 B - - |
| 1 5 - - - | 1 - - - - | - - - - - | - - - - - |

| Y | Y | N | 1 |

See Appendix A, Section A.8, for the file format.

2.2.2.3 Component Status Report (CSR) File

The Component Status Report File contains data on the amount of time spent by a programmer on different activities and components (modules) in the development process. The time spent on components is divided into design, code, and test stages. One record on the CSR File represents one line on

the CSR form; a form may spread over several records. A record (line) contains the following:

- Programmer
- Form date
- Component
- Hours spent in each phase
- Other activity (name)
- Other activity (hours spent)

The CSR form is filled out by the programmer once a week.

Below are three sample records in the CSR File. The hours shown represent real numbers even though they are shown as integers. The correct real number value is obtained by dividing the given number by 10. Hyphens represent blanks.

| <u>Form Number</u> | <u>Sequence Number</u> | <u>Project</u> | <u>Programmer</u> | <u>Form Date</u> |
|--------------------|------------------------|----------------|-------------------|------------------|
| B03146 | 1 | 36 | 22137 | 791012 |
| B03146 | 2 | 36 | 22137 | 791012 |
| B03146 | 3 | 36 | 22137 | 791012 |

| <u>Component</u> | <u>Design Create Hours</u> | <u>Design Read Hours</u> | <u>Design Review Hours</u> | <u>Code Hours</u> |

| 0 | 0 | 0 | 0 | 0 |
| - | - | - | - | - |

| <u>Other Activity Name</u> | <u>Other Activity Hours</u> | <u>Status Flag</u> | <u>Phase Flag</u> |
|------------------------------------|-------------------------------------|------------------------|-----------------------|
| - | - | 1 | D |
| - | - | 1 | D |
| TRAVEL | 5 | 1 | D |

See Appendix A, Section A.9, for the file format.

2.2.2.4 Component Summary Form (CSF) File

The Component Summary Form File contains a general description of a component. This form is filled out by the programmer twice: when a component is first defined, it is filled out with estimates of the effort and size of the component; when the component is completed, it is filled out with the actual values. There should be two forms for each component at the completion of a project. One record in the CSF File represents one form. Each record contains the following information:

- Programmer
- Form date
- Form stage
- Component
- Precision of specification
- Complexity
- Type of software
- Type of statements
- Number of statements
- Relation to other software
- Type of addition (if addition)
- Number of components called, shared, and descendent
- Languages used
- Form of specification
- Constraints (yes/no)
- Number of design, code, and test runs

- Design, code, and test computer time used
- Time/effort spent in design, code, and test
- Design, code, and test end dates

Below are three sample records on the CSF File. Hyphens represent blanks.

| <u>Form Number</u> | <u>Project</u> | <u>Programmer Filling Out Form</u> | <u>Programmer Implementing Component</u> | <u>Form Date</u> |
|--------------------|----------------|------------------------------------|--|------------------|
| 101878 | 36 | 2 | 2 | 800606 |

See Appendix A, Section A.10, for the file format.

2.2.2.5 General Project Summary (GPS) File

The General Project Summary File contains a summary of resources, times, program sizes, costs, and several other aspects of a project. The GPS form is filled out by the project manager or project leader at the beginning and end of the project and at the end of major phases. The following information is contained on the GPS File:

- Project description
- Resources used
- Scheduling
- Cost of project
- Size of project
- Computer access
- Techniques employed
- Formalisms used
- Automated tools used
- Type of project organization
- Standards used
- Milestones reached
- Documentation issued

- Problems encountered
- Quality assurance employed

See Appendix A, Section A.11, for the file format.

2.2.2.6 Resource Summary Form (RSF) File

The Resource Summary Form File contains information on programmer time, computer time and runs, and other service charges. The resources are recorded by the project manager for each week for up to 11 weeks on a single form. Each record in the file contains information from one line of the RSF File, either manpower, computer, or services data. A record contains the following information:

- Resource type indicator (manpower, computer, or services)
- Resource code
- Form date
- Percentage management
- Beginning date of data
- Hours each week (up to 11 weeks)
- Number of computer runs each week (up to 11 weeks)

Below are three sample RSF File records. The resource hours are integers representing real number values times 10.

Hyphens indicate blanks. The number sign (#) indicates the week (1 through 11).

| <u>Form Number</u> | <u>Sequence Number</u> | <u>Project</u> | <u>Resource Type</u> | <u>Resource</u> |
|------------------------|----------------------------|----------------|--------------------------|-----------------|
| C00144 | 1 | 36 | M | 18024 |
| C00144 | 2 | 36 | M | 22137 |
| C00144 | 3 | 36 | C | 1 |

| | | <u>Form Date</u> | <u>Percent Management</u> | <u>Beginning Date Of Data</u> | | |
|---------------------|-----------------------------------|----------------------|-----------------------------------|---------------------------------------|----------------------------------|--|
| | | 791214 | 100 | 791005 | | |
| | | 791214 | 10 | 791005 | | |
| | | 791214 | - | 791005 | | |
| <u>Runs #1</u> | <u>Resource Hours #1</u> | <u>Runs #2</u> | <u>Resource Hours #2</u> | <u>Runs #3</u> | <u>Resource Hours #3</u> | |
| 0 | 100 | 0 | 100 | 0 | 100 | |
| - | - | 0 | 240 | 0 | 400 | |
| 0 | 240 | - | - | 5 | 10 | |

| 0 | 400 | - | - | 1 | D | |
| - | - | - | - | 1 | D | |
| 0 | 0 | 0 | 0 | 1 | D | |

See Appendix A, Section A.12, for the file format.

2.2.2.7 Run Analysis Form (RAF) File

The Run Analysis Form File contains information about computer runs made by a programmer on a project. The RAF,

filled out by the programmer, has data from up to nine separate runs. One record represents one line (run) on the RAF. The following information is contained on the RAF File:

- Programmer
- Run date
- Computer model used
- Interactive run indicator
- Purpose of run (unit test, maintenance)
- Number and type of components
- Whether or not first run
- Whether or not run met objectives
- Run results

Below are three sample records on the RAF File. Hyphens indicate blanks.

| <u>Form Number</u> | <u>Sequence Number</u> | <u>Project</u> | <u>Programmer</u> | <u>Run Date</u> |
|--------------------|------------------------|----------------|-------------------|-----------------|
| J01946 | 1 | 42 | 22137 | 791025 |
| J01946 | 2 | 42 | 22137 | 791025 |
| J01946 | 3 | 42 | 22137 | 791026 |

| <u>Computer</u> | <u>Interactive Run Indicator</u> | <u>Run Purpose</u> <u>1 2 3 4</u> | <u>Number Of Components</u> |
|-----------------|----------------------------------|--------------------------------------|-----------------------------|
| 6 | X | 4 7 - - | 2 |
| 6 | - | 7 - - - | 1 |
| 3 | - | 7 - - - | 1 |

| | <u>Components</u> | | | | | <u>First Run Indicator</u> | <u>Run Met Objectives Indicator</u> |

| | <u>1</u> | <u>2</u> | <u>3</u> | <u>4</u> | <u>5</u> | | |
| 280 | 4 | - | - | - | - | X | Y |
| 4 | - | - | - | - | - | - | - |
| 10 | - | - | - | - | - | - | - |

| Run Result | Comment Indicator | Status Flag |
|----------------|----------------------|----------------|
| <u>1 2 3 4</u> | | |
| 1 4 - - | N | 1 |
| 4 - - - | N | 1 |
| 4 - - - | N | 1 |

See Appendix A, Section A.13, for the file format.

2.2.3 AUXILIARY FILES

This subsection describes the remaining six file types, which are identified as auxiliary files:

1. Accounting Information (ACC) File
2. Comment (CMT) File
3. Component Information File (CIF)
4. Growth History (HIS) File
5. Source Analyzer Program (SAP) Output File
6. Transaction Files

2.2.3.1 Accounting Information (ACC) File

The Accounting Information File contains accounting information for jobs run on the IBM S/360-95 and -75. Each record contains information relating to a specific 4-hour block of time (i.e., 1 day's activities on a computer are represented by six records). A record contains the following information:

- Date
- Start time of 4-hour period
- CPU and I/O time for the IBM S/360-95 and -75
- Number of runs for the IBM S/360-95 and -75
- Number of remote job entry (RJE) jobs
- Number of card reader jobs

This information is obtained from an accounting history tape on the IBM S/360, which is generated from an online accounting system that monitors all activity on the particular machine.

See Appendix A, Section A.14, for the file format.

2.2.3.2 Comment (CMT) File

The Comment File contains all comments from the Change Report Form, the Component Summary Form, and the Run Analysis Form for a given project. (The component status report and resource summary forms do not have comment fields.) Each record on the CMT File contains a comment and the number of the originating form. This file is automatically updated by DBAM whenever one of the form types with comments is processed. This information is stored separately, since it was felt that most users of the form data files would generally not want the comment information. Therefore, the form data files were made smaller by deleting this text information.

Below are three sample records on the CMT File:

| <u>Form Number</u> | <u>Sequence Number</u> | <u>Comment Type</u> | <u>Record Number</u> | <u>Project</u> |
|-----------------------------------|--------------------------------------|-------------------------|--------------------------|------------------------|
| 101878 | 1 | D | 1 | 36 |
| 101879 | 1 | D | 1 | 36 |
| 101880 | 1 | U | 1 | 36 |
| <u>Continuation Indicator</u> | <u>Text</u> | | | <u>Status Flag</u> |
| N | FILL PREREAD ARRAYS | | | 1 |
| N | DRIVER FOR READING TELEMETRY RECORDS | | | 1 |
| N | CHECKS BUFFER SIZE | | | 1 |

See Appendix A, Section A.15, for the file format.

2.2.3.3 Component Information File (CIF)

The Component Information File was developed to characterize each component. This file contains several source code statistics for each component. Some of the items are general library information, such as how many changes were made to a component. The rest are statistics extracted from the

FORTTRAN source code of the component by SAP. Each CIF record contains the following information:

- Component name and code
- PANVALET level number (number of source changes)
- Module and subsystem function
- Whether component is new, old, or modified
- Number of executable statements
- Number of lines with comments
- Number of comment lines
- Number of unique operators
- Number of unique operands
- Total number of operators
- Total number of operands
- Number of input and output variables from module
- Number of decisions
- Number of FUNCTION references
- Number of I/O statements
- Number of assignment statements
- Number of CALL statements
- Number of FORMAT statements

Note that operands and operators are software measures described by Halstead in Reference 4.

There is a unique correspondence between the component name and component code listed above that serves as a dictionary for all component codes used in other data base files for a particular project.

Below are three sample records on the CIF. Hyphens indicate blanks.

| <u>Project</u> | <u>Component Name</u> | <u>Component Code</u> | <u>PANVALET Level Number</u> | <u>Module Function</u> |
|----------------|-----------------------|-----------------------|------------------------------|------------------------|
| 19 | ACBIAS | 275 | 4 | - |
| 19 | ACBIASM | 350 | - | - |
| 19 | ACBIASUN | 351 | - | - |

| <u>Subsystem Function</u> | <u>Origin</u> | <u>Executable Statements</u> | <u>Source Lines</u> | <u>Comments</u> |
|-------------------------------|---------------|----------------------------------|-------------------------|-----------------|
| - | - | 90 | 254 | 102 |
| - | 1 | 31 | 104 | 44 |
| - | 1 | 17 | 89 | 43 |

| <u>Operators</u> | <u>Operands</u> | <u>Total Operators</u> | <u>Total Operands</u> | <u>Input and Output Variables</u> |
|------------------|-----------------|----------------------------|---------------------------|---|
| 24 | 64 | 421 | 315 | 29 |
| 9 | 25 | 158 | 155 | 9 |
| 9 | 19 | 70 | 67 | 10 |

| <u>Decisions</u> | <u>FUNCTION References</u> | <u>I/O Statements</u> | <u>Assignment Statements</u> | <u>CALL Statements</u> |
|------------------|--------------------------------|---------------------------|----------------------------------|----------------------------|
| 21 | 29 | 1 | 50 | 18 |
| 2 | 0 | 1 | 27 | 0 |
| 2 | 0 | 1 | 13 | 0 |

| <u>FORMAT Statements</u> | <u>Status Flag</u> |
|------------------------------|------------------------|
| 2 | 1 |
| 2 | 1 |
| 2 | 1 |

See Appendix A, Section A.16, for the file format.

2.2.3.4 Growth History (HIS) File

The Growth History File contains information about the changing number of modules and lines of code for each project. Each record contains a date and the total number of source code lines, modules, and changes up to that date. This information comes from weekly listings of the PANVALET library directory for projects using the IBM computers and from weekly file directory listings for projects using the DEC computers.

Below are three sample records from the HIS File.

| <u>Project</u> | <u>Date</u> | <u>Source Lines to Date</u> | <u>Modules to Date</u> | <u>Changes to Date</u> | <u>Status Flag</u> |
|----------------|-------------|-------------------------------------|----------------------------|----------------------------|------------------------|
| 10 | 770923 | 12414 | 143 | 12 | 1 |
| 10 | 770930 | 12414 | 143 | 12 | 1 |
| 10 | 771007 | 15973 | 172 | 56 | 1 |

See Appendix A, Section A.17, for the file format.

2.2.3.5 SAP Output File

The SAP Output File is a single intermediate sequential file containing several source code statistics produced by SAP. Each record in this file contains information on individual components, such as the number of executable statements and the number of assignment statements. The record format is similar to that of the CIF but not identical. Some rearrangement is made before DBAM moves the data into the appropriate CIF.

Below are three sample records from the SAP Output File.

| <u>Project Name</u> | <u>Module Name</u> | <u>Parameters Passed In</u> | <u>Comment Lines</u> | <u>Executable Statements</u> |
|-------------------------|------------------------|---------------------------------|--------------------------|----------------------------------|
| PROJ2 | ACDUMFL1 | 28 | 105 | 93 |
| PROJ2 | TPTPCHEK | 3 | 63 | 12 |
| PROJ5 | DAINRT | 6 | 32 | 1 |

| <u>I/O Statements</u> | <u>Source Lines</u> | <u>Operators</u> | <u>Operands</u> | <u>Total Operators</u> |
|---------------------------|-------------------------|------------------|-----------------|----------------------------|
| 1 | 252 | 12 | 105 | 316 |
| 1 | 82 | 7 | 8 | 27 |
| 0 | 39 | 0 | 0 | 0 |

| <u>Total Operands</u> | <u>Number Of IF and .IF Statements</u> | <u>Decisions</u> | <u>Input and Output Var. to Module</u> | <u>COMMON Variables</u> |
|----------------------------------|--|------------------------------|--|------------------------------|
| 280 | 1 | 4 | 57 | 6 |
| 12 | 5 | 6 | 3 | 0 |
| 0 | 0 | 0 | 6 | 0 |
| <u>DO and DOWHILE Statements</u> | <u>FUNCTION References</u> | <u>Structured Statements</u> | <u>Parameters Passed Out</u> | <u>Assignment Statements</u> |
| 3 | 0 | 0 | 73 | 64 |
| 0 | 0 | 8 | 5 | 0 |
| 0 | 0 | 0 | 0 | 0 |
| | <u>CALL Statements</u> | | <u>FORMAT Statements</u> | |
| | 22 | | 2 | |
| | 5 | | 1 | |
| | 0 | | 0 | |

See Appendix A, Section A.18, for the file format.

2.2.3.6 Transaction Files

Transaction Files are sequential backup disk files that contain a record of all additions, deletions, and changes made to the data base since the last DBAM backup. (A DIAM tape backup run resets the number of transaction records to zero.) There are seven transaction files in the data base: one for each form type (CRF, CSF, CSR, RAF, and RSF), one for the CIFs, and one for the HIS Files. DBAM automatically adds to the Transaction Files whenever data in the data base are added, changed, or deleted.

See Appendix A, Section A.19, for the file format.

2.3 GENERAL NOTES ON THE DATA BASE DATA

All data on the data base are stored in character format. All fields displayed as numbers are right justified and

blank filled except for dates, which are zero filled with a format of YYMMDD. In many cases, an all-blank integer field (as opposed to a zero) indicates missing data.

Component codes are associated with component names on the CIFs, whereas all other coded fields are defined on the Encoding Dictionary.

All forms processed are given a unique six-character string (a letter followed by five digits)--for example, B00138.¹

The letter represents the form type as follows:

| | | |
|--------|-------------------|-----|
| A or J | Run Analysis | RAF |
| B | Component Status | CSR |
| C | Resource Summary | RSF |
| D or K | Change Report | CRF |
| E or I | Component Summary | CSF |

A phase flag (R, D, or M) indicates whether the form came from the requirements, development, or maintenance teams. (Development in this case refers to the time between the design start date and the cleanup end date as defined on the Phase Dates File.)

All but four file types have a status flag. (The Encoding Dictionary, the File Name and Status File, the Subjective Evaluations Directory File, and the SAP Output File do not have status flags.) New records are entered with a status of 1 (for "unchecked"). After hand validation, the status will be reset to 2. After data are verified by application, the status will be reset to 3.

¹The format of the RAF, CRF, and CSR forms has evolved. Each revision of a form was assigned a new prefix to the form number. Thus, in some cases a file may contain form records with form numbers prefixed by one of two possible letters.

SECTION 3 - DATA BASE USER'S GUIDE

This section contains information on data base access and use. It is assumed that the user understands the basic operation and capabilities of the DEC PDP-11/70 (References 5 and 6). This section also describes the capabilities of DBAM (Reference 2), a general indexed file access program (DATATRIEVE) (Reference 7), and several other basic profile reporting programs. The support software that is described includes the following:

1. DBAM--Data Base Maintenance Software, used to access and validate data base data
2. SEL data base header files listing procedures--DATATRIEVE command procedures to list the contents of the SEL data base header files
- 3. NF--Form-counting report program that counts the number of forms by programmer for a given project
4. RPSTSCTR--Record-counting report program that counts the number of records on each data base file
5. WK--Hour- and form-counting report program that counts forms and programmer hours by programmer by week for a given project for any form type
6. PF--Basic profile report program that sums responses from files of any form type
7. RU--Resource utilization report program that summarizes manpower and computer resources
8. CS--Detailed component status report program that reports CSR File data by programmer by project
9. REP4, REP5--CIF reporting programs that list components, their software type, and Halstead measures

All these programs reside on DB1:[204,5] (except DATATRIEVE, which is already installed). Helpful user information also exists on the .HLP files on DB1:[204,5].

3.1 DATA BASE MAINTENANCE SOFTWARE

The DBAM system has five basic functions:

1. CREATE--Create new files for given project.
2. ARCHIVE--Back up all data base files on tape.
3. RESTORE--Restore all or specific files of the data base from the backup tape.
4. COMPRESS--Compress data base files to reduce space used and increase access efficiency.
5. UPDATE--Add, change, or delete data base records. All new data are validated to prevent the entry of incorrect data. UPDATE is the primary function used in the general data entry process.

To run this program, the user must log on under [204,3] (no password) and enter the following (the indirect command file):

@SELDBS

For complete information on how to run DBAM, see file DB1:[204,5]SELDBS.HLP or Reference 2.

3.2 SEL DATA BASE HEADER FILES LISTING PROCEDURES

The following five DATATRIEVE command procedures are used to list the contents of the five SEL data base header files:

1. DBRPTDIR--Lists the contents of the Subjective Evaluations Directory file and produces a formatted report in SEFDIR.RPT under the user's user identification code (UIC)

2. DBRPTENC--Lists the contents of the Encoding Dictionary and produces a formatted report in ENC.RPT under the user's UIC
3. DBRPTTEST--Lists the contents of the Estimated Statistics File and produces two formatted reports in EST1.RPT and EST2.RPT under the user's UIC
4. DBRPTHDR--Lists the contents of the Phase Dates File and produces a formatted report in HDR.RPT under the user's UIC
5. DBRPTSTS--Lists the contents of the File Name and Status File and produces a formatted report in STAT.RPT under the user's UIC

DATATRIEVE is a DEC-supplied, file-access program allowing formatted listings to be made of the record contents of any Record Management System (RMS) indexed file. DATATRIEVE should be used to verify exactly what data exist in the data base. To execute these procedures, the user enters DTR. A prompt of "DTR>" is displayed to indicate that DATATRIEVE is running. The user can then enter the indirect file name for the desired listings: @[204,4]DBRPTDIR.DTR, @[204,4]DBRPTENC.DTR, @[204,4]DBRPTTEST.DTR, @[204,4]DBRPTHDR.DTR, or @[204,4]DBRPTSTS.DTR. For more information on how to use DATATRIEVE, see Reference 7.

3.3 FORM COUNTER (NF)

This form-counting program produces a one-page report of the number of each type of form on the data base for each programmer for a particular project. Indirect files are allowed in response to the prompt for a project name.

3.4 RECORD COUNTER (RPSTCTR)

This record-counting program produces a single-page report of the number of all records in all file types for all projects. Note that for some file types, the number of records

equals the number of forms and that for other file types they are not equal.

3.5 HOURLY AND FORM COUNTER BY WEEK (WK)

This program produces a one- to two-page report of the number of forms or the number of hours or runs by programmer by week for a specific project. Indirect files are allowed.

3.6 GENERALIZED RESPONSE ACCUMULATOR (PF)

This is a basic profile program that currently reports on four file types: the CIF, the CRF File, the CSF File, and the RAF File. This program reports the counts of the responses of each field broken down by another field count. Indirect files are allowed.

3.7 RESOURCE UTILIZATION REPORT (RU)

The resource utilization report program produces a three-page report of manpower and computer resource data of a given project. There are two sections to the report. The first is a summary of programmer, manager, and services hours broken down by the five middle phases on the Phase Dates File. The second section shows run, change, and line counts.

This program obtains the resource data first from the RSF File and then from the CSR File.

3.8 DETAILED COMPONENT STATUS REPORT (CS)

This program produces a report of the data on a specific project's CSR File. The report prints separate sections for each programmer on the project. Each section has two parts: the activity section, which is a summary of OTHER hours, and the component section, which lists the hours spent on each component.

3.9 COMPONENT INFORMATION FILE REPORTS (REP4, REP5)

Two similar report programs produce detailed reports of the CIF. The first, REP5, produces a list of components and their associated Halstead parameters computed from the basic data on each CIF record. (For more information on Halstead's measures, see Reference 4.) The second report, REP4, produces a similar list of components and associated data by type of software and sorted by number of executable statements.

The type of software categories used in REP4 are listed below:

| <u>Code</u> | <u>Type</u> |
|-------------|------------------------------------|
| A | I/O (input/output) |
| B | Control/driver |
| BA | Control/driver with I/O |
| C | Control/computational |
| CA | Control/computational with I/O |
| D | Algorithmic/data transfer |
| DA | Algorithmic/data transfer with I/O |
| E | Block data |

3.10 POTENTIAL PROBLEMS

This subsection contains some notes on situations that may prevent further processing.

1. If an unfamiliar abnormal end (ABEND) of execution occurs while running a program, the complete error message should be recorded and brought to the attention of programming personnel or the data base administrator. An ABEND may lock files, which means that those files are inaccessible and the program may not be run again until the files are unlocked.

2. To unlock a locked file, the user must either log on with the UIC of the owner of the file or use the main console (privileged UIC) and enter "PIP file,ext/UN".

3. If the VT100 keyboard locks for any reason (nothing can be entered), the SET-UP key should be pressed twice to unlock it.

4. If a user program continues to run beyond its desired use, it can be terminated or stopped by entering "ABO TTn" (ABORT), where n is the terminal number. If it is an installed program such as DTR or FOR, it can be terminated by entering "ABO nam", where nam is the three-letter name of the program. If new output continues to be displayed on the screen, CONTROL C should be entered before trying to terminate.

APPENDIX A - DATA BASE FILE FORMATS

This appendix describes, in detail, field definitions for all files in the data base.

| <u>Section</u> | <u>Page</u> | <u>Record Length</u> | <u>Name or Extension</u> | <u>File Description</u> |
|----------------|-------------|----------------------|--------------------------|---|
| A.1 | A-2 | 60 | ENCODE.HDR | Encoding Dictionary |
| A.2 | A-3 | 120 | EST.HDR | Estimated Statistics |
| A.3 | A-5 | 52 | STAT.HDR | File Name and Status |
| A.4 | A-6 | 112 | HEADER.HDR | Phase Dates |
| A.5 | A-8 | Variable | SEF.HDR | Subjective Evaluations |
| A.6 | A-48 | 100 | DIR.HDR | Subjective Evaluations Directory |
| A.7 | A-49 | 72 | ATM | Attitude Maintenance Change Report |
| A.8 | A-51 | 101 | CRF | Change Report Form |
| A.9 | A-55 | 79 | CSR | Component Status Report |
| A.10 | A-56 | 250 | CSF | Component Summary Form |
| A.11 | A-61 | 0 | GPS | General Project Summary |
| A.12 | A-62 | 115 | RSF | Resource Summary Form |
| A.13 | A-63 | 53 | RAF | Run Analysis Form |
| A.14 | A-65 | 67 | ACC | Accounting Information |
| A.15 | A-67 | 104 | CMT | Comment |
| A.16 | A-68 | 80 | CIF | Component Information |
| A.17 | A-70 | 29 | HIS | Growth History |
| A.18 | A-71 | 78 | ALL.SAP | Source Analyzer Program output (for all projects) |
| A.19 | A-72 | - | - | Transaction (different record length for each file) |

The seven Transaction Files are located on DB0:[204,1].
Component codes are defined in the CIF.

A.1 ENCODING DICTIONARY (ENC) FILE

| <u>Item</u> | <u>Location</u> | <u>Format</u> | <u>Description</u> |
|-------------|-----------------|---------------|--|
| 1 | 1-3 | I3 | Code type Numeric code identifying the category |
| 2 | 4-8 | A5 | Code Alphanumeric code identifying a particular value |
| 3 | 9-16 | A8 | Abbreviation (e.g., JCLERROR) |
| 4 | 17-60 | 44A1 | Verbal description of code |

Primary key: Code type and code (bytes 1 through 8)

Secondary key: Code type and abbreviation (bytes 1 through 3 and 9 through 16, split key)

A.2 ESTIMATED STATISTICS (EST) FILE

| <u>Item</u> | <u>Location</u> | <u>Format</u> | <u>Description</u> |
|-------------|-----------------|---------------|---|
| 1 | 1-8 | 8A1 | Project name (e.g., MAGBIAS) |
| 2 | 9-10 | I2 | Project code from ENCODE.HDR |
| 3 | 11-14 | I4 | Number of components |
| 4 | 15-18 | I4 | Total number of modules |
| 5 | 19-22 | I4 | Number of new modules |
| 6 | 23-26 | I4 | Number of modified modules |
| 7 | 27-32 | I6 | Number of computer runs |
| 8 | 33-38 | I6 | Number of source code changes |
| 9 | 39-44 | I6 | Number of pages of documen- tation |
| 10 | 45-50 | I6 | Total number of lines of code |
| 11 | 51-56 | I6 | Number of new lines of code |
| 12 | 57-62 | I6 | Number of modified lines of code |
| 13 | 63-68 | I6 | Total number of executable statements |
| 14 | 69-74 | I6 | Number of new executable statements |
| 15 | 75-80 | I6 | Number of modified execut- able statements |
| 16 | 81-86 | F6.1 | Programmer work hours (in tenths) |
| 17 | 87-92 | F6.1 | Management work hours (in tenths) |
| 18 | 93-98 | F6.1 | Other (services) work hours (in tenths) |
| 19 | 99-104 | F6.1 | IBM S/360-95 computer hours (in tenths) |
| 20 | 105-110 | F6.1 | IBM S/360-75 computer hours (in tenths) |
| 21 | 111-116 | F6.1 | Other computer hours (in tenths) |

| <u>Item</u> | <u>Location</u> | <u>Format</u> | <u>Description</u> |
|-------------|-----------------|---------------|--|
| 22 | 117 | I1 | Status flag: = 1, unchecked = 2, hand checked = 3, verified by application |
| 23 | 118 | A1 | Active flag: = Y, active = N, inactive = blank, no response |
| 24 | 119 | I1 | Project category: = 1, attitude oriented = 2, orbit oriented = 3, scientific oriented = 4, data base oriented = 5, tool = 6, real time = 7, other = blank, no response |
| 25 | 120 | A1 | Spare |

Primary key: Project code (bytes 9 through 10)

Secondary key: Project name (bytes 1 through 8)

A.3 FILE NAME AND STATUS (STS) FILE

| <u>Item</u> | <u>Location</u> | <u>Format</u> | <u>Description</u> |
|-------------|-----------------|---------------|---|
| 1 | 1-2 | I2 | Project code from ENCODE.HDR |
| 2 | 3-4 | I2 | File code from ENCODE.HDR |
| 3 | 5-29 | 25A1 | File name (fully qualified) (e.g., DB1:[204.1]SMM.RSF) |
| 4 | 30-35 | I6 | Creation date of file (YYMMDD) |
| 5 | 36-41 | I6 | Last backup date of file (YYMMDD) |
| 6 | 42-47 | I6 | Last update date of file (YYMMDD) |
| 7 | 48-52 | I5 | Number of records in file |

Primary key: Project code and file code (bytes 1 through 4)

Secondary key: Project code (bytes 1 and 2)

Tertiary key: File code (bytes 3 and 4)

Quaternary key: File name (bytes 5 through 29)

A.4 PHASE DATES FILE (HDR)

| <u>Item</u> | <u>Location</u> | <u>Format</u> | <u>Description</u> |
|-------------|-----------------|---------------|--|
| 1 | 1-8 | 8A1 | Project name (e.g., MAGBIAS) |
| 2 | 9-10 | I2 | Project code from ENCODE.HDR |
| 3 | 11-12 | I2 | Development computer from ENCODE.HDR: = 1, IBM S/360 = 2, DEC PDP-11/70 = blank, no response |
| 4 | 13-14 | I2 | Target computer from ENCODE.HDR: = 1, IBM S/360 = 2, DEC PDP-11/70 = blank, no response |
| 5 | 15 | I1 | Extent of alien computer use |
| 6 | | | PHASE DATES |
| 7 | 16-21 | I6 | Requirements start (YYMMDD) |
| 8 | 22-27 | I6 | Requirements end (YYMMDD) |
| 9 | 28-33 | I6 | Design start (YYMMDD) |
| 10 | 34-39 | I6 | Design end (YYMMDD) |
| 11 | 40-45 | I6 | Code and test start (YYMMDD) |
| 12 | 46-51 | I6 | Code and test end (YYMMDD) |
| 13 | 52-57 | I6 | System test start (YYMMDD) |
| 14 | 58-63 | I6 | System test end (YYMMDD) |
| 15 | 64-69 | I6 | Acceptance test start (YYMMDD) |
| 16 | 70-75 | I6 | Acceptance test end (YYMMDD) |
| 17 | 76-81 | I6 | Cleanup start (YYMMDD) |
| 18 | 82-87 | I6 | Cleanup end (YYMMDD) |
| 19 | 88-93 | I6 | Maintenance start (YYMMDD) |
| 20 | 94-99 | I6 | Maintenance end (YYMMDD) |
| 21 | 100-111 | A12 | Spares |

| <u>Item</u> | <u>Location</u> | <u>Format</u> | <u>Description</u> |
|-------------|-----------------|---------------|---|
| 22 | 112 | 11 | Status flag: = 1, unchecked = 2, hand checked = 3, verified by application |

Primary key: Project code (bytes 9 and 10)

Secondary key: Project name (bytes 1 through 8)

A.5 SUBJECTIVE EVALUATIONS FILE (SEF)

Each project has seven records of varying length as described below.

A.5.1 SEF RECORD 1

| <u>Item</u> | <u>Location</u> | <u>Format</u> | <u>Description</u> |
|-------------|-----------------|---------------|---|
| 1 | 1-2 | I2 | Project code from ENCODE.HDR |
| 2 | 3 | I1 | Record sequence number |
| 3 | 4 | I1 | Status flag for the Practices and Techniques (MT) measure: = 1, unchecked = 2, hand checked = 3, verified by application |
| 4 | 5 | I1 | Evaluation code for the MT measure ORGANIZATION |
| 5 | 6-7 | F2.1 | Chief programmer |
| 6 | 8-9 | F2.1 | Not defined |
| | | | DESIGN |
| 7 | 10-11 | F2.1 | Walkthroughs |
| 8 | 12-13 | F2.1 | Formal reviews |
| 9 | 14-15 | F2.1 | Formalisms |
| 10 | 16-17 | F2.1 | Tree charts |
| 11 | 18-19 | F2.1 | Program Design Language (PDL) |
| 12 | 20-21 | F2.1 | Hierarchical Input Processing Output (HIPO) |
| 13 | 22-23 | F2.1 | Top-down |
| 14 | 24-25 | F2.1 | Iterative enhancement |
| 15 | 26-27 | F2.1 | N-squared charts |
| 16 | 28-29 | F2.1 | Not defined |
| 17 | 30-31 | F2.1 | Not defined |
| 18 | 32-33 | F2.1 | Not defined |

| <u>Item</u> | <u>Location</u> | <u>Format</u> | <u>Description</u> |
|-------------|-----------------|---------------|--|
| CODE | | | |
| 19 | 34-35 | F2.1 | Stubs |
| 20 | 36-37 | F2.1 | Top-down |
| 21 | 38-39 | F2.1 | Structured |
| 22 | 40-41 | F2.1 | Walkthroughs |
| 23 | 42-43 | F2.1 | Reading |
| 24 | 44-45 | F2.1 | Configuration control |
| 25 | 46-47 | F2.1 | Not defined |
| 26 | 48-49 | F2.1 | Not defined |
| 27 | 50-51 | F2.1 | Not defined |
| TEST | | | |
| 28 | 52-53 | F2.1 | Formalism |
| 29 | 54-55 | F2.1 | Followthrough |
| 30 | 56-57 | F2.1 | Batch |
| 31 | 58-59 | F2.1 | IV & V presence |
| 32 | 60-61 | F2.1 | IV & V use |
| 33 | 62-63 | F2.1 | Not defined |
| 34 | 64-65 | F2.1 | Not defined |
| SUMS | | | |
| 35 | 66-68 | F3.1 | Items 7 through 14 |
| 36 | 69-71 | F3.1 | Items 19 through 24 |
| 37 | 72-74 | F3.1 | Items 28 through 32 |
| 38 | 75-78 | F4.1 | Items 35 through 37 and item 5 |
| 39 | 79 | I1 | Status flag for the Tools (TS) measure: = 1, unchecked = 2, hand checked = 3, verified by application |
| 40 | 80 | I1 | Evaluation code for the TS measure |
| 41 | 81-82 | F2.1 | Formal training in methodology |
| 42 | 83-84 | F2.1 | Informal training |
| 43 | 85-86 | F2.1 | Methodology reinforcement |

| <u>Item</u> | <u>Location</u> | <u>Format</u> | <u>Description</u> |
|-------------|-----------------|---------------|--|
| 44 | 87-88 | F2.1 | Requirements language (MEDL-R) |
| 45 | 89-90 | F2.1 | Design language (PDL) |
| 46 | 91-92 | F2.1 | Precompiler (SFORT) |
| 47 | 93-94 | F2.1 | Software aids (e.g., XREF, MAP, LIST) |
| 48 | 95-96 | F2.1 | Librarian |
| 49 | 97-98 | F2.1 | Data generators |
| 50 | 99-100 | F2.1 | Terminals (TSO) |
| 51 | 101-102 | F2.1 | Remote Job Processing (RJP) |
| 52 | 103-104 | F2.1 | Configuration Analysis Tool (CAT) |
| 53 | 105-106 | F2.1 | Not defined |
| 54 | 107-108 | F2.1 | Not defined |
| 55 | 109-110 | F2.1 | Not defined |
| 56 | 111-113 | F3.1 | Sum items 41 through 52 |
| 57 | 114 | I1 | Status flag for the Documentation (DC) measure: = 1, unchecked = 2, hand checked = 3, verified by application |
| 58 | 115 | I1 | Evaluation code for the DC measure |
| 59 | 116-117 | F2.1 | SEL forms |
| 60 | 118-119 | F2.1 | Design document |
| 61 | 120-121 | F2.1 | Design decisions |
| 62 | 122-123 | F2.1 | Semiformal quality assurance |
| 63 | 124-125 | F2.1 | Activity notebooks |
| 64 | 126-127 | F2.1 | Unit development folders |
| 65 | 128-129 | F2.1 | Test plans |
| 66 | 130-131 | F2.1 | User's guide/system description |
| 67 | 132-133 | F2.1 | Formal treatment of user's guide/system description |
| 68 | 134-135 | F2.1 | Weekly/monthly progress reports |

| <u>Item</u> | <u>Location</u> | <u>Format</u> | <u>Description</u> |
|-------------|-----------------|---------------|---|
| 69 | 136-137 | F2.1 | Not defined |
| 70 | 138-139 | F2.1 | Not defined |
| 71 | 140-141 | F2.1 | Not defined |
| 72 | 142-143 | F2.1 | Not defined |
| 73 | 144-145 | F2.1 | Not defined |
| | | | SUMS |
| 74 | 146-148 | F3.1 | Items 59 through 68 |
| 75 | 149-152 | F4.1 | Item 38, item 56*500/ 600, and item 74 |
| 76 | 153-162 | A10 | Spares |

Primary key: Project code and record sequence number
(bytes 1 through 3)

A.5.2 SEF RECORD 2

| <u>Item</u> | <u>Location</u> | <u>Format</u> | <u>Description</u> |
|-------------|-----------------|---------------|--|
| 1 | 1-2 | I2 | Project code from ENCODE.HDR |
| 2 | 3 | I1 | Record sequence number |
| 3 | 4 | I1 | Status flag for the Experience with Application (AP) measure: = 1, unchecked = 2, hand checked = 3, verified by application |
| 4 | 5 | I1 | Evaluation code for the AP measure |
| 5 | 6-7 | F2.1 | Expert 1 |
| 6 | 8-9 | F2.1 | Expert 2 |
| 7 | 10-11 | F2.1 | Expert 3 |
| 8 | 12-13 | F2.1 | Expert 4 |
| 9 | 14-15 | F2.1 | Expert 5 |
| 10 | 16-17 | F2.1 | Project manager |
| 11 | 18-19 | F2.1 | Project leader |
| 12 | 20-21 | F2.1 | Programmers |
| 13 | 22-23 | F2.1 | Analysts |
| 14 | 24-25 | F2.1 | Participation in requirements definition |
| 15 | 26-27 | F2.1 | Participation in design |
| 16 | 28-29 | F2.1 | Team interactions before project |
| 17 | 30-31 | F2.1 | Not defined |
| 18 | 32-33 | F2.1 | Not defined |
| 19 | 34-35 | F2.1 | Not defined |
| | | | SUMS |
| 20 | 36-38 | F3.1 | Items 5 through 9 |

| 22 | 42-44 | F3.1 | Items 14 through 16 |
| 23 | 45-47 | F3.1 | Items 5 through 16 |

| <u>Item</u> | <u>Location</u> | <u>Format</u> | <u>Description</u> |
|-------------|-----------------|---------------|--|
| 24 | 48 | I1 | Status flag for the Effectiveness of Management (MG) measure: = 1, unchecked = 2, hand checked = 3, verified by application |
| 25 | 49 | I1 | Evaluation code for the MG measure |
| | | | PRELIMINARY DESIGN |
| 26 | 50-51 | F2.1 | Project manager |
| 27 | 52-53 | F2.1 | Project leader |
| 28 | 54-55 | F2.1 | Analysis manager |
| 29 | 56-57 | F2.1 | Analysis leader |
| 30 | 58-59 | F2.1 | Development manager |
| 31 | 60-61 | F2.1 | Development leader |
| | | | DETAILED DESIGN |
| 32 | 62-63 | F2.1 | Project manager |
| 33 | 64-65 | F2.1 | Project leader |
| 34 | 66-67 | F2.1 | Analysis manager |
| 35 | 68-69 | F2.1 | Analysis leader |
| 36 | 70-71 | F2.1 | Development manager |
| 37 | 72-73 | F2.1 | Development leader |
| | | | IMPLEMENTATION |
| 38 | 74-75 | F2.1 | Project manager |
| 39 | 76-77 | F2.1 | Project leader |
| 40 | 78-79 | F2.1 | Analysis manager |
| 41 | 80-81 | F2.1 | Analysis leader |
| 42 | 82-83 | F2.1 | Development manager |
| 43 | 84-85 | F2.1 | Development leader |
| | | | SYSTEM TESTING |
| 44 | 86-87 | F2.1 | Project manager |
| 45 | 88-89 | F2.1 | Project leader |
| 46 | 90-91 | F2.1 | Analysis manager |
| 47 | 92-93 | F2.1 | Analysis leader |

| <u>Item</u> | <u>Location</u> | <u>Format</u> | <u>Description</u> |
|--------------------|-----------------|---------------|--|
| 48 | 94-95 | F2.1 | Development manager |
| 49 | 96-97 | F2.1 | Development leader |
| ACCEPTANCE TESTING | | | |
| 50 | 98-99 | F2.1 | Project manager |
| 51 | 100-101 | F2.1 | Project leader |
| 52 | 102-103 | F2.1 | Analysis manager |
| 53 | 104-105 | F2.1 | Analysis leader |
| 54 | 106-107 | F2.1 | Development manager |
| 55 | 108-109 | F2.1 | Development leader |
| STABILITY | | | |
| 56 | 110-111 | F2.1 | Project manager |
| 57 | 112-113 | F2.1 | Project leader |
| 58 | 114-115 | F2.1 | Analysis manager |
| 59 | 116-117 | F2.1 | Analysis leader |
| 60 | 118-119 | F2.1 | Other changes |
| SUMS | | | |
| 61 | 120-122 | F3.1 | Items 26 through 31 |
| 62 | 123-125 | F3.1 | Items 32 through 37 |
| 63 | 126-128 | F3.1 | Items 38 through 43 |
| 64 | 129-131 | F3.1 | Items 44 through 49 |
| 65 | 132-134 | F3.1 | Items 50 through 55 |
| 66 | 135-137 | F3.1 | Items 56 through 60 |
| 67 | 138-140 | F3.1 | Items 26, 32, 38, 44, 50 |
| 68 | 141-143 | F3.1 | Items 27, 33, 39, 45, 51 |
| 69 | 144-146 | F3.1 | Items 28, 34, 40, 46, 52 |
| 70 | 147-149 | F3.1 | Items 29, 35, 41, 47, 53 |
| 71 | 150-152 | F3.1 | Items 30, 36, 42, 48, 54 |

| <u>Item</u> | <u>Location</u> | <u>Format</u> | <u>Description</u> |
|-------------|-----------------|---------------|---|
| 12 | 47 | A1 | Run met objectives: = Y, yes = N, no = blank, no response |
| 13 | 48-51 | 4A1 | Run results (up to 4 responses, from ENCODE.HDR): = 1, good run = 2, submit error = 3, JCL error = 4, other setup error = 5, hardware error = 6, software error = 7, compile error = 8, link error = 9, execution error = A, user-generated message = B, ran to completion = blank, no response |
| 14 | 52 | A1 | Comment indicator: = Y, yes = N, no |
| 15 | 53 | I1 | Status flag: = 1, unchecked = 2, hand checked = 3, verified by application |

Primary key: Form and sequence number (bytes 1 through 8)

A.14 ACCOUNTING INFORMATION (ACC) FILE

Each record contains totals for a particular 4-hour block of wallclock time.

| <u>Item</u> | <u>Location</u> | <u>Format</u> | <u>Description</u> |
|-------------|-----------------|---------------|--|
| 1 | 1-2 | I2 | Project code from ENCODE.HDR |
| 2 | 3-8 | I6 | Date (YYMMDD) |
| 3 | 9-10 | I2 | Time block (4-hour block) 0, 4, 8, 12, 16, or 20 hours from start of day |
| 4 | 11-13 | I3 | TSO foreground computer runs |
| 5 | 14-16 | I3 | TSO background computer runs |
| 6 | 17-19 | I3 | RJE computer runs |
| 7 | 20-22 | I3 | Card reader computer runs |
| | | | PRIMARY COMPUTER |
| 8 | 23 | I1 | Computer code from ENCODE.HDR |
| 9 | 24-28 | F5.3 | Total CPU time (in thousandths of hours) |
| 10 | 29-33 | F5.3 | Total I/O time (in thousandths of hours) |
| 11 | 34-36 | I3 | Total number of computer runs |
| 12 | 37-39 | I3 | Number of runs excluding condition code 0000 or S00C |
| | | | SECONDARY COMPUTER |
| 13 | 40 | I1 | Computer code from ENCODE.HDR |
| 14 | 41-45 | F5.3 | Total CPU time (in thousandths of hours) |

| <u>Item</u> | <u>Location</u> | <u>Format</u> | <u>Description</u> |
|-------------|-----------------|---------------|---|
| 15 | 46-50 | F5.3 | Total I/O time (in thousandths of hours) |
| 16 | 51-53 | I3 | Number of computer runs |
| 17 | 54-56 | I3 | Number of computer runs excluding condition code 0000 or S00C |
| 18 | 57 | I1 | Status flag: = 1, unchecked = 2, hand checked = 3, verified by application |
| 19 | 58-67 | A10 | Spares |

Primary key: Date and time block (bytes 3 through 10)

A.15 COMMENT (CMT) FILE

| <u>Item</u> | <u>Location</u> | <u>Format</u> | <u>Description</u> |
|-------------|-----------------|---------------|--|
| 1 | 1-6 | A6 | Form number (e.g., D00633) |
| 2 | 7-8 | I2 | Sequence number |
| 3 | 9 | A1 | Comment type: = C, comment = D, description = R, reason = U, useful item |
| 4 | 10 | I1 | Record continuation number of this comment |
| 5 | 11-12 | I2 | Project code from ENCODE.HDR |
| 6 | 13 | A1 | Comment is continued: = Y, yes = N, no |
| 7 | 14-103 | A90 | Text |
| 8 | 104 | I1 | Status flag: = 1, unchecked = 2, hand checked = 3, verified by applica- tion |

Primary key: Form number + sequence number + comment type +
record number (bytes 1 through 10)

A.16 COMPONENT INFORMATION FILE (CIF)

| <u>Item</u> | <u>Location</u> | <u>Format</u> | <u>Description</u> |
|-------------|-----------------|---------------|--|
| 1 | 1-2 | I2 | Project code from ENCODE.HDR |
| 2 | 3-10 | A8 | Component name (e.g., TPNAML) |
| 3 | 11-13 | I3 | Component code |
| 4 | 14-15 | I2 | PANVALET level number |
| 5 | 16-17 | I2 | Module function from ENCODE.HDR |
| 6 | 18-19 | I2 | Subsystem function from ENCODE.HDR |
| 7 | 20 | I1 | Origin from ENCODE.HDR: = 1, new code = 2, extensively modified old code = 3, slightly modified old code = 4, exact copy of old code |
| 8 | 21-24 | I4 | Number of executable source code statements |
| 9 | 25-28 | I4 | Number of lines of code with comments |
| 10 | 29-31 | I4 | Number of comment lines |
| 11 | 32-34 | I3 | Number of unique operators (operators and operands are Halstead's measures (Reference 4)) |
| 12 | 35-37 | I3 | Number of unique operands |
| 13 | 38-41 | I4 | Total number of operators |
| 14 | 42-45 | I4 | Total number of operands |
| 15 | 46-48 | I3 | Number of input and output variables from module |
| 16 | 49-51 | I3 | Number of decisions (McCabe's measure (Reference 8)) |
| 17 | 52-54 | I3 | Number of FUNCTION references |
| 18 | 55-57 | I3 | Number of I/O statements |

| <u>Item</u> | <u>Location</u> | <u>Format</u> | <u>Description</u> |
|-------------|-----------------|---------------|---|
| 19 | 58-60 | I3 | Number of assignment statements |
| 20 | 61-63 | I3 | Number of subroutine CALL statements |
| 21 | 64-66 | I3 | Number of FORMAT statements |
| 22 | 67 | I1 | Status flag: = 1, unchecked = 2, hand checked = 3, verified by application |
| 23 | 68-80 | A13 | Spares |

Primary key: Component name (bytes 3 through 10)
Secondary key: Component name prefix (bytes 3 and 4)
Tertiary key: Component code (bytes 11 through 13)

A.17 GROWTH HISTORY (HIS) FILE

| <u>Item</u> | <u>Location</u> | <u>Format</u> | <u>Description</u> |
|-------------|-----------------|---------------|--|
| 1 | 1-2 | I2 | Project code from ENCODE.HDR |
| 2 | 3-8 | I6 | Date (YYMMDD) |
| 3 | 9-14 | I6 | Number of lines of code with comments to date |
| 4 | 15-17 | I3 | Number of modules to date |
| 5 | 18-23 | I6 | Number of changes to date |
| 6 | 24 | I1 | Status flag: = 1, unchecked = 2, hand checked = 3, verified by applica- tion |
| 7 | 25-29 | A5 | Spares |

Primary key: Date (bytes 3 through 8)

A.18 SOURCE ANALYZER PROGRAM (SAP) OUTPUT FILE

This is a single sequential file.

| <u>Item</u> | <u>Location</u> | <u>Format</u> | <u>Description</u> |
|-------------|-----------------|---------------|--|
| 1 | 1-8 | A8 | Project name (e.g., MAGBIAS) |
| 2 | 9-16 | A8 | Module name |
| 3 | 17-19 | I3 | Number of parameters passed in calling sequence |
| 4 | 20-22 | I3 | Number of comment lines |
| 5 | 23-26 | I4 | Number of executable statements |
| 6 | 27-28 | I2 | Number of I/O statements |
| 7 | 29-32 | I4 | Number of lines with com- ments |
| 8 | 33-35 | I3 | Number of unique operators |
| 9 | 36-38 | I3 | Number of unique operands |
| 10 | 39-42 | I4 | Total number of operators |
| 11 | 43-46 | I4 | Total number of operands |
| 12 | 47-49 | I3 | Number of IF and .IF statements |
| 13 | 50-52 | I3 | Number of decisions |
| 14 | 53-55 | I3 | Number of input and output variables to module |
| 15 | 56-58 | I3 | Number of COMMON area variables |
| 16 | 59-60 | I2 | Number of DO and DOWHILE statements |
| 17 | 61-63 | I3 | Number of FUNCTION refer- ences |
| 18 | 64-66 | I3 | Number of structured statements |
| 19 | 67-69 | I3 | Number of variables passed out |
| 20 | 70-72 | I3 | Number of assignment statements |
| 21 | 73-75 | I3 | Number of subroutine CALL statements |
| 22 | 76-78 | I3 | Number of FORMAT statements |

A.19 TRANSACTION FILES

The Transaction Files are sequential disk backup files that contain records of all updates made to the corresponding data base files, as follows:

| <u>Transaction File</u> | <u>Corresponding Data Base File</u> |
|-------------------------|-------------------------------------|
| TRANS.CRF | Change Report Form Files |
| TRANS.CSR | Component Status Report Files |
| TRANS.CSF | Component Summary Form Files |
| TRANS.RSF | Resource Summary Form Files |
| TRANS.RAF | Run Analysis Form Files |
| TRANS.CIF | Component Information Files |
| TRANS.HIS | Growth History Files |

Each file has a format similar to its corresponding data base file. The first byte indicates whether the record has been added, changed, or deleted (A, C, or D). Bytes 2 through 7 contain the date (YYMMDD) the record was accessed. Bytes 8 through 13 are spares. Bytes 14 through the end of the record contain the record as stored on the corresponding data base file.

For example, the CRF Files have a record length of 101 bytes. The CRF Transaction File has a record length of $101 + 13 = 114$ bytes. All additions, changes, and deletions of records on any of the CRF Files by DBAM are recorded on a single CRF Transaction File, which has the same record format except that byte 1 will be an A, C, or D; bytes 2 through 7 contain the date; and bytes 8 through 13 are blank.

APPENDIX B - SAMPLE DATA COLLECTION FORMS

The forms reproduced here are used by the SEL at the Goddard Space Flight Center to collect data on development projects. The terms used in these forms are defined in Section B.2.

B.1 SAMPLE DATA COLLECTION FORMS AND INSTRUCTIONS

This section contains sample data collection forms and instructions for their use. The instructions precede the forms. The following forms are included:

1. General Project Summary (GPS)
2. Resource Summary Form (RSF)
3. Component Summary Form (CSF)
4. Component Status Report (CSR)
5. Run Analysis Form (RAF)
6. Change Report Form (CRF) and Attitude Maintenance Change Report (ATM)

**ORIGINAL PAGE IS
OF POOR QUALITY**

**INSTRUCTIONS FOR COMPLETING THE GENERAL
PROJECT SUMMARY - FORM 580-1 (2/77)**

This form is used to classify the project and will be used in conjunction with the other reporting forms to measure the estimated versus actual development progress. It should be filled out by the project manager at the beginning of the project, at each major milestone, and at the end. Numbers and dates used at the initiation of the project are assumed to be estimated; intermediate reports should change estimates to actuals (if known) and update estimates. The final report should accurately describe the system development life cycle.

A. PROJECT DESCRIPTION

Description. Give an overview of the project.

Inputs. Specifications and requirements (etc.) of project. Give the format of these.

Requirements. How requirements are established and changed.

Products Developed. List all items developed for the project (e.g., operational system, testing system, simulator, etc.).

Products Delivered. List all items required to be delivered (e.g., source of the operational system, object code of the operational system, design documents, etc.).

B. RESOURCES

Target Computer System. System for which software was developed.

Development Computer System. System on which software was developed.

Constraints. List any size or time constraints for the finished product. Do you anticipate any problems in meeting these constraints?

Useful Items From Similar Projects:

1. List previous projects, which will contribute various aspects to this project.
2. For each project, give the percent of the current project it makes up in each of the 3 listed aspects.
3. For each of the 3 listed aspects (specification, design, code) check what level of modifications are necessary.

C. TIME

Start Date. First date of work, including design and modification of the specifications.

End Date. Delivery date.

Estimated Lifetime. Estimate the operational life of the system.

Mission Date. Scheduled operation date of the system (write unknown if not known or undecided yet on any of these dates). Date project must be operational.

Confidence Level. Give the percent probability you think the end date is realistic. (e.g., 100% means certain delivery on that date, 0% means no chance of delivery.)

**ORIGINAL PAGE IS
OF POOR QUALITY**

D. COST

Cost. Total amount of money the project costs, including both contract and in-house costs.

Maximum Available. Maximum amount available, independent of what estimated cost is.

Confidence Level. Rate percent reliability in cost estimate.

How Determined. At initiation how is it estimated, at completion how is it calculated.

Personnel. Give the number of full time equivalent persons required at inception of the project, 1/3 of the way into the project, 2/3 of the way into the project, at the completion of the project.

Total Person Months. Give the total number of months that full time equivalent personnel (managers, designers, programmers, keypunchers, editors, secretaries, etc.) are assigned to the project. Do not include all overhead items such as vacation and sick leave.

Computer Time. Give the total number of hours on all systems normalized to one machine (e.g., the IBM 360/75) and name the machine.

E. SIZE

Size of the System. Include the total amount of machine space needed for all instructions generated on the project plus the space for data, library routines (e.g., FORTRAN I/O package) and other code already available. Break down size into data space and instruction space.

Confidence Level. Rate percent reliability in size estimates.

Total Number of Source Statements. Give the number of FORTRAN, ALC, or any other language instructions generated specifically for this project.

Structure of System. Give overall structure of system. Is it a single load module, is it an overlay structure, or is it a set of independent programs? For overlay and separate programs, give the number and average size of each.

Define Your Concept of a Module. Give the criteria you are using to divide the software into modules.

Estimated Number of Modules. Include only the number of new modules to be written.

Range in Module Size. Give the number of instructions in the minimum, maximum and average module and the language in which they are written as a reference.

Number of Different I/O Formats Used. Give the number of distinct external data sets that are required for the system including card reader, printer, graphics device, and temporary files.

F. COMPUTER ACCESS

A librarian is a person who can be used to perform any of the clerical functions associated with programming, including those given on the chart. Check the appropriate boxes for those persons who have access to the computer to perform the given functions. Give the percentage of time spent by each in batch and interactive access to the computer.

ORIGINAL PAGE IS
OF POOR QUALITY

G. TECHNIQUES EMPLOYED

For "level," specify to what level of detail in the finished project the technique is used. (e.g., subroutine, module, segments of 1000 lines, top level, etc.)

Specifications

Functional - Components are described as a set of functions, each component performing a certain action.

Procedural - Components are specified in some algorithmic manner (e.g., using a PDL).

English - Components are specified using an English Language prose statement of the problem.

Formal - Some other formal system is used to specify the components.

Design and Development

Top Down - The implementation of the system one level at a time, with the current level and expansion of the yet to be defined subroutines at the previous higher level.

Bottom Up - The implementation of the system starting with the lowest level routines and proceeding one level at a time to the higher level routines.

Iterative Enhancement - The implementation of successive implementations, each producing a usable subset of the final product until the entire system is fully developed.

Hardest First - The implementation of the most difficult aspects of the system first.

Other - Describe the strategy used if it is not a combination of any of the above.

None Specified - No particular strategy has been specified.

Coding. The final encoding of the implementation in an executable programming language.

Structured Code With Simulated Constructs - The language does not support structured control structures (e.g., FORTRAN) but they are simulated with the existing structures; please state the structured control structures you are using (e.g., WHILE, CASE, IF).

Structured Control Constructs - The language supports structured control structures (e.g., a FORTRAN preprocessor) please list structures you are using.

Other Standard - Describe any other standard you are using.

None Specified - No particular strategy has been specified.

Validation/Verification. Testing: execution of the system, via a set of test cases.

Top Down - Stubs or dummy procedures are written to handle the yet to be implemented aspects of the system and testing begins with the top level routines and proceeds as new levels are added to the system.

Bottom Up - Check out of a module at a time using test drivers and starting at the bottom level modules first.

ORIGINAL PAGE IS OF POOR QUALITY

Structure Driven - Using structure of program to determine test data (e.g., every statement of program executed at least once).

Specification Driven - Using specifications of program to determine test data (e.g., all input/output relationships hold for a set of test data).

Other - Describe any other strategy you are using.

None Specified - No testing strategy has been specified.

Validation/Verification, Inspection: visual examination of the code or design.

Code Reading - Visual inspection of the code or design by other programmers.

Walk Throughs - Formal meeting sessions for the review of code and design by the various members of the project, for technical rather than management purposes.

Proofs - Formal proofs of the design or code; please specify the techniques used, e.g., axiomatic, predicate transforms, functional, etc.

None Specified - No inspection techniques have been specified.

There is some space given to permit the further explanation of any of the strategies that may be used.

H. FORMAL NOTATIONS USED AT VARIOUS LEVELS AND PHASES

Give the phases (e.g., design, implementation, testing, etc.) and levels (subroutine, module, segments of 1000 lines, top level, etc.) at which any type of formalism (flowchart, PDL, etc.) will be used in the development of the system.

I. AUTOMATED TOOLS USED

Name all automated tools used, including automated versions of the formalisms given above and compilers for the programming languages used, and at which phase and at what level they are used. Include any products that may be developed as part of this project (e.g., simulator).

J. ORGANIZATION

Describe how the personnel are subdivided with respect to responsibilities into teams or groups, giving titles, brief job descriptions, the number of people satisfying that title and their names and organizational affiliations if known.

K. STANDARDS

List all standards used, whether they are required or optional, and the title of the document describing the standard.

L. MILESTONES

Give the phase at which management may check on progress of the development of the system (e.g., specification, design, implementation of version 1, etc.). State also the date at which it should take place (at completion of the project), how it is to be determined that the milestone was reached, who will be responsible for reviewing the progress at that point and what the review procedure will be. Also give the resources used since the last milestone. For

**ORIGINAL PAGE 1
OF POOR QUALITY**

size of system give the current size of the system at that milestone. Each milestone has 2 confidence levels, one for time estimates and one for resource expenditures. For estimated future milestone, the first confidence level for the probability of reaching the milestone at that date. The second is for the accuracy of the resources used. For past milestones, the first confidence level is normally 100% (actual date) while the second is an estimate on the accuracy of the accounting system.

M. DOCUMENTATION

For each time of documentation developed, state the type of documentation, its purpose, the date it should be completed, its size and list any tools used in its production. (At the beginning of the project these should be estimates, at the end of the project, they should be accurate figures.)

N. PROBLEMS

Give the three most difficult problems you expect to encounter managing this project. Please be as specific as possible.

O. QUALITY ASSURANCE

To what do you attribute your confidence in the completed system. Be as specific as possible.

PERSON FILLING OUT FORM _____

**ORIGINAL PAGE IS
OF POOR QUALITY**

INSTRUCTIONS FOR COMPLETING THE RESOURCE SUMMARY

This form keeps track of the project costs on a weekly basis. It should be filled out by the project manager every week of the project duration.

PROJECT. Give project name.

DATE. List date form turned in.

NAME. Name of project manager.

WEEK OF. List date of each successive Friday.

MANPOWER. List all personnel on the project on separate lines. Give the number of hours each spent that week on the project.

% OF MANAGEMENT. Add the % of time this person spent managing the project during this reporting period. A new form should be used if this % changes.

COMPUTER USAGE. List all machines used on the project. For each machine give the number of runs during each week and the amount of computer time used.

OTHER. List any other charges to the project.

**ORIGINAL PAGE IS
OF POOR QUALITY**

RESOURCE SUMMARY

PROJECT _____ DATE _____

NAME _____

[illegible]

ORIGINAL PAGE IS OF POOR QUALITY

INSTRUCTIONS FOR COMPLETING THE COMPONENT SUMMARY

This form is used to keep track of the components of a system. A component is a piece of the system identified by name or common function (e.g., an entry in a tree chart or baseline diagram for the system at any point in time, or a shared section of data such as a COMMON block). With the information on this form combined with the information on the Component Status Report, the structure and status of the system and its development can be monitored.

This form should be filled out for each component at the time that the component is defined, at the time it is completed, and at any point in time when a major modification to the component is made. It should be filled out by the person responsible for the component.

PROJECT. Give project name.

DATE. Give date form filled out.

NAME OF COMPONENT. Give name (up to 8 characters) by which the component will be referred to in other forms.

BRIEF DESCRIPTION. State function of component.

TYPE OF SOFTWARE. Check all classifications that apply. All common blocks are separate components.

STATUS OF COMPONENT. Check whether this is a new component, whether it is a component under development (e.g., a previous component summary has already been submitted), or whether the component is now complete.

A. CODE SPECIFICATIONS. Give the form of design for this component, and tell to what level of detail the specifications are given.

Functional—Components are described as a set of functions, each component performing a certain action.

Procedural—Components are specified in some algorithmic manner (e.g., using a PDL).

English—Components are specified using an English Language prose statement of the problem.

Formal—Some other formal system is used to specify the components.

Relative to the one developing the components, rate the precision of the specifications. Very precise means that no additional analysis on the problem is needed, precise means that only easy or trivial ideas have to be developed, and imprecise means that much work still remains in developing this component and its basic structure.

B. INTERFACES

Give the relative position of this component in the system. Give the number and list the names of all components that call this component, and are called by this component. Also, give the names of any components or other items this component shares with other components (e.g., COMMON blocks, external data). The components directly descended from this component refers to the tree chart of the system. If the interfaces are not yet complete, check "Not Fully Specified".

C. PROGRAMMING LANGUAGES

List languages (or assembly languages) to be used to implement this component. If more than one, list percentages of each (in lines of source code). If there are any constraints on the component (e.g., size, execution time) list them. Also give estimated size of finished component in terms of source statements, (estimate size with comments and without comments) and resulting machine languages (including data areas, but not COMMON blocks).

Useful Items From Similar Projects

1. List previous components and projects which contribute various aspects to this component.
2. For each such component, give the percent of each of the three listed aspects it makes up (e.g., a component may be 50% of design but only 25% of code due to changed interfaces, etc.).
3. For each of the three listed aspects, check what level of modifications are necessary.

ORIGINAL PAGE IS
OF POOR QUALITY

D. COMPLEXITY

Rate your belief in the complexity of the implementation. Also approximate the number (by %) of assignment type statements (input statements are included), and control statements (those that alter the flow of control e.g., IF, CALL, GOTO). The sum of these two may not be 100% (e.g., CONTINUE, DIMENSION and REAL statements will not be counted). I/O and declarations should be listed as other.

E. RESOURCES TO IMPLEMENT

For each of the three listed phases (Design, Code, Test), estimate computer runs, time needed, hours to implement, and estimated completion date. If not known, or no estimate can be given, write "unknown".

F. ORIGIN OF COMPONENT

If this component is independent of any other component of the system (e.g., is a low level component which is designed first, or is the root node of the tree chart) then check yes, otherwise check no.

If no is checked, then explain why the component was added. (Usually only one reason will be checked, although more may be checked, if appropriate).

A lower level elaboration of a higher level component means that an existing component was expanded to include new components (e.g., expanding tree chart). List the higher level component time.

Added as a driver or interface means that a calling program was added to call existing components. List these called components.

A redesign of an existing component means that new capabilities were added to an already existing component. Write its name.

A renaming of an older component. Give the old name.

A regrouping of existing material means that several components were redesigned with a new component resulting from this redesign. Give the old component names.

Type of addition. Why was this component added to the system at this time? Check the appropriate reason. (Normally, only one should be checked, although more can be if appropriate.)

G. ADDITIONAL COMMENTS. Add any other comments that will help explain the purpose, design, and complexity of this component.

H. PERSON RESPONSIBLE. Include name of person responsible for implementing component.

I. PERSON FILLING OUT FORM. Give name of person filling out form. This normally is the same name as in H.

**ORIGINAL PAGE 13
OF POOR QUALITY**

INSTRUCTIONS FOR COMPLETING THE COMPONENT STATUS REPORT

This form is to be used to accurately keep track of the development of each component in the system. A Component Summary Report should exist for each component mentioned. The form is to be turned in at the end of each week. Please fill out either daily or once each week. If daily, then a given component may be listed several times during the course of a week. For each component list the number of hours spent on each of the listed activities. This form should be filled out by persons working on the project.

PROJECT. Name of the project.

PROGRAMMER. Name of programmer.

DATE. Date report turned in. Usually the date of a Friday.

COMPONENT. Name of component. Either a part of the system structure for which there is a component summary form, or one of the following:

JCL. Developing command language instructions.

Overlay. Developing system overlay structure.

User Guide. User's Guide Documentation.

System Description. System Description Documentation.

DESIGN

Crete. Writing of a component design.

Read. Reading (by peer) of design to look for errors. (e.g., peer review)

Formal Review. Formal meeting of several individuals for purpose of explaining design. Also include time spent in preparing for review. All those attending review should list components discussed in their own Component Status Report for that week.

CODE/DEVELOPMENT

Code. Writing executable instructions and desk checking program.

Read. Code reading by peer. Similar to Design Read above.

Formal Review. Review of coded components. Similar to Design Review above.

TESTING

Unit. Unit testing. Test run with test data on single module.

Integ. Integration testing of several components.

Review. Review of testing status.

OTHER. Any other aspect related to a component of the project not already covered other than Design, Code Development, Test (e.g., Documentation of a specific component). List type of activity, and hours spent on that activity. A set of activities has been listed for which time may be charged to the overall project:

Travel. Time spent on official travel related to this project, (including trips to and from GSFC).

Forms. Time spent on filling out reporting forms.

Meetings. Time spent in meetings which are not design or code review meetings.

Training. Training activities identified for project.

Acc Test. Acceptance Testing activities.

COMPONENT STATUS REPORT

DATE _____

INSTRUCTIONS FOR COMPLETING THE COMPUTER PROGRAM RUN ANALYSIS FORM

This form will be used to monitor the activities for which the computer is used in the course of a project life cycle. An entry should be made for each computer run-including all activities performed when the computer is used in an interactive mode.

PROGRAMMER. Write down name of person preparing computer runs. This may not necessarily be the person running the program (i.e., librarian).

PROJECT. Write down project name. Use a different form for each project.

COMPUTER. Indicate the machine on which these runs were made (e.g., S/360, PDP-11, ES).

DATE. Date form turned in.

JOB ID. Identification of job

RUN DATE. Date run submitted in format MM-DD (month-day).

INTERACTIVE. Place an X if the run was submitted from an interactive terminal.

RUN PURPOSE. Place an X in all boxes that describe this run.

Unit Test. A purpose of the run is to test one or more components without the rest of the system being configured into the load module. A run which uses a 'test driver' would fall into this category.

System Test. This run executes a load module which contains all of the currently available system in order to test one or more components in a full system configuration.

Benchmark Test. This is a recertification type run. A run that has successfully executed in the past is now rerun to verify that certain capabilities still exist.

Maintenance/Utility. A purpose of this run is to perform a 'library-type' function. Examples are runs that update source, create backups, delete compress/copy data sets.

Compile/Assembly/Link. A purpose of the run is to check for errors in the compile, assembly and/or link steps. A run which includes one or more of these steps simply as a prerequisite to a system execution would not fall into this category.

Debug Run. This run was submitted in order to investigate a known error.

Other. This run has a purpose which does not fall into one of the other categories. Examples are runs which access other systems in order to aid in the design, development and/or testing of the project under study.

COMPONENTS OF INTEREST. List all components important to this run (e.g., components being tested, compiled, copied, etc.)

FIRST RUN. Place an X here if this is the first time any of the listed components have been processed by the computer for the purpose of run specified.

MEETS OBJECTIVES. This is a subjective evaluation of whether the run satisfied your objectives. Runs that terminate in errors may be satisfactory if the objective was to locate errors or to test for correctness; runs that terminate normally may be unsatisfactory if the purpose was to locate an error known to be present. Thus this question is independent of whether the program contained any errors or not.

RUN RESULTS. Check the box that best describes the results of this run. Normally only one box is checked, although more than one may be checked if appropriate.

Good Run. Program ran to termination with no known errors.

Setup Error. Error in creating program deck.

Submit Error. Deck submitted incorrectly, resources unavailable, keypunch error, or general submission error.

JCL Error. JCL statement incorrect. (JCL cards mistyped should be listed under submit errors.)

Other Setup Error. Such as insufficient space or time specified for job step. This should not be caused by program error.

Machine Error. Errors outside of the control of the programmer.

Hardware Error. Machine malfunction.

Software Error. System crash or system program error (e.g., error in FORTRAN compiler).

Program Error. Error caused by the submitted program.

Compile Error. The source program contains an error which is found by the compiler or assembler.

Link Error. The loader or linkage editor finds an error.

Execute Error. System error messages are generated during the execution step, possibly causing an abend.

User Generated Error. The program terminates in a programmer generated error message which is not a system error.

Ran to Completion. The program terminated with no error message; however, the results are incorrect signifying that there is something wrong with the program.

COMMENTS. If you believe that your answers to these questions do not adequately characterize this run, you may add any additional comments that you wish. Also use this space to indicate if the run was lost before you had a chance to evaluate results.

ORIGINAL PAGE IS OF POOR QUALITY

INSTRUCTIONS FOR COMPLETING THE CHANGE REPORT FORM

This form is used to keep track of all changes made to a system. A change is any alteration to the design, documentation, or code generated for a project. Each change can be thought of as a step in the process of transforming the original software design into a complete working system. The initial creation of sections of fresh code or design is not a change.

One change report form should be filled out for each change. Where several changes are made simultaneously for different reasons a separate form should be completed for each reason.

NUMBER. A unique identifier per form per day consisting of initials followed by a sequence number. The initials should be those of the person filling out the form. The sequence number should be a positive integer indicating the number of forms filled out so far during the day. Number DMW01 indicates the first form of the day filled out by DMW, DMW02 is the second form that day, etc.

PROJECT NAME. The name of the development project.

CURRENT DATE. The date on which an entry is first made on the form, even if the form is not completed on that day.

SECTION A-IDENTIFICATION

REASON. Explain why the change is being made.

DESCRIPTION. Describe the change that is being made. This should not be on the variable name or bit level, but should be sufficiently abstract so that the function of the changed code can be determined, e.g., "the input buffer was cleared," rather than "array buff was set to zero."

EFFECT. What components (or documents) are changed? List the names of all components and documents modified as part of the change, including version numbers.

EFFORT: What additional components (or documents) were examined in determining what change was needed? List all components and documents that were examined, but were not actually changed, in deciding what change to make, how to make it, and where to make it. This list should not overlap with the list of components and documents actually changed.

DATES OF CHANGE. Need for change determined on. Give the date on which it was first realized that a change was needed.

Change started on. Give the date on which the change was started.

What was the effort in person-time required to understand and implement the change?

Give the best available estimate of the total time needed to understand what change had to be made and how to make it, including the implementation time. This should include the time of all persons involved in making the change. As an example, if two people each worked 6 hours on the change, the space marked "one day to 3 days" should be checked.

SECTION B-TYPE OF CHANGE

Check the one box that best describes the change. If none of the change descriptions seem to fit, check other and give a detailed description of the change in Section E. If several of the descriptions seem equally appropriate, more than one box may be checked.

Error Correction. A change made to correct an error in previous work. If this box is checked Sections C and D of the change report form should be completed.

Planned Enhancement. The insertion of a body of code into a program stub that was initially created as a dummy for testing purposes, or adding capability to an already existing component as part of a planned incremental development.

Implementation of Requirements Change. Altering the system to conform to a change in requirements imposed by the customer.

Improvement of Clarity, Maintainability, or Documentation. Changes made to improve code quality, such as improving indentation of code, resequencing labels for readability, adding or updating documentation or correcting literary errors in it, suppressing redundant information or replacing multiply-occurring sections of code with procedure calls. Corrections of violations of programming standards, and design improvements that should have been visible in the functional specifications of components of the system are to be treated as error corrections. Documentation updates made concomitantly with a change should be treated as a part of that change and classified with the primary cause of the change.

Improvement of User Services. During system development, individual programmers may find that with very little extra work they can provide the user with additional facilities on top of the functional requirements of the system. Such changes are classed as improvements to user services.

ORIGINAL PAGE IS OF POOR QUALITY

Insertion/Deletion of Debug Code. Changes made to the program text specifically to provide additional information during test runs so that errors can be isolated.

Optimize Time/Space/Accuracy. An optimization is a localized adjustment of the program whose main purpose is to reduce its execution time or memory requirements, or to obtain results of greater numerical accuracy by tuning the algorithms used to the specific problem being solved.

Adaptation to Environment Change. The "boundary" of a software system is defined to include just those programs whose development and maintenance is being monitored as part of the software engineering laboratory project. A change whose cause lies outside this boundary (e.g., in response to an operating system, compiler, or hardware change) is regarded as environmentally caused.

Was more than one component affected by the change? A component is defined to be directly involved in a change if it contains subroutines that are changed and it contains no subcomponents containing those subroutines. Check yes if the change directly involves more than one component of the system, no otherwise. It may be the case that a change to one subroutine/component will require some future adjustment in other components (these components may not even have been coded yet, or their adaptation may be postponed). In such cases, the effects of the change involve more than one component even though only one module was noted as changed on this form.

SECTION C--TYPE OF ERROR

Check the one box that best describes the error. If none of the error descriptions seem to fit, check other and give a detailed description of the error in Section E.

Requirements Incorrect or Misinterpreted. Requirements may be incorrect (inconsistent or ambiguous), or their meaning may be misinterpreted. In either case, an error of this type, if undetected early, may propagate through design and into code. Even undetected until acceptance testing (or maintenance), errors resulting from incorrect or misinterpreted requirements should be classified in the requirements error category.

Functional Specifications Incorrect or Misinterpreted. Functional specifications are taken to be a specification of a component as a set of functions defining the output for any input. Similar to requirements, specifications may be either incorrect or misinterpreted. Errors in the specifications that occur as a result of misunderstandings of requirements are classified as misinterpreted requirements errors and not incorrect specifications. Specification errors that result from misunderstandings among those writing the specifications are classified as incorrect specifications. Errors in code or design or documents resulting from incorrect or misinterpreted specifications should be classified in the specifications error category.

Design Error Involving Several Components. A design decision is a choice of organization of a component into subcomponents, including the specification of the interfaces among the subcomponents. A design error is a design decision that results in one of the following:

- interfaces that contain insufficient, unnecessary, or redundant information;
- a set of subcomponents that do not satisfy the specifications of the component (i.e., one or more of the subcomponents do not have the capabilities needed to satisfy the use intended for the component).

Note that a design error may result from incorrect or misinterpreted requirements or specifications. In such cases, the error should not be classified as a design error, but as a requirements or specification error.

Error in the Design or Implementation of a Single Component. Most simple, localized programming mistakes fall into this category. It contains those cases where the organization of the system into components and their interfaces is correct, but a particular component does not behave according to its intended use (i.e., does not correspond to its specification). This may occur because the algorithm used in designing the component is incorrect, or because the implementation of the algorithm is incorrect. If the algorithm has a written specification prior to code generation, and the specification is incorrect or misinterpreted, the error is not classified as a design or implementation error, but as a specification error. If the erroneous algorithm has no written specification, or if the implementation of the algorithm has errors not attributable to any other category, then the error is classified as an error in the design or implementation of a single component.

Misunderstanding of External Environment, Except Language. Check this box if the error resulted from mistaken assumptions about the hardware or software environment in which the program operates (i.e., that software outside the "boundary" of the project--see "adaptation to environment change" in Section B). Included here are mistaken assumptions about how the operating system works, about how the hardware is controlled, about response of peripherals to various commands, about the operation of the library system, about the interface to special display hardware or software, etc.

Error in Use of Programming Language/Compiler. Errors in the use of the language/compiler are those errors that result from some misunderstanding of how the compiler works, how the language provided run-time support system operates, or some misunderstanding of particular language features. Not included in this category are clerical errors (e.g., typos) that lead to compilation errors.

ORIGINAL PAGE IS OF POOR QUALITY

Clerical Error. Clerical errors are those errors that occur in the mechanical translation of an item from one format to another (e.g., one coding sheet to another), or from one medium to another (e.g., coding sheets to cards). No interpretation or semantic translation is involved in such a process.

FOR DESIGN OR IMPLEMENTATION ERRORS ONLY

This section should be filled out only if the error was a design error, involving several components, or if it was an error in the design or implementation of a single component. Errors that occur in the design of a system, subsystem, set of components, or single component, or in the implementation of a single component, may be categorized in one of two ways. Either there was an error in the use of data, or there was an error in the function of a component (such as an algorithmic or computational error resulting in program behavior not corresponding to the intended use of the program). Data use errors can be characterized as either incorrect values for data items or improper assumptions about the structure of data items (e.g., array sizes or dimensions, or ordering of items in a list). Errors involving the function of a component include control and computational errors, such as incorrect sequencing of statements, omitted statements (where such are not clerical errors), or properly computed expressions, omitted capabilities of the component(s), etc.

SECTION D—VALIDATION AND REPAIR

What were the activities used to validate the program, to detect the error, and find its cause?

The purpose of this section is to discover how it became known that an error existed and how the cause of the error was determined. A check should be put in the first column for each method used for validating the component(s) where the error was found. A check should be put in the second column on the same line as the method by which the symptoms of this particular error was first noted. The third and fourth columns refer to activities used to find the cause of the error, once it was known that the error existed. In the third column, check all techniques used in trying to find the cause of the error. In the fourth column, check those techniques that yielded the information needed to find the cause. In some cases, such as some errors found by code reading, the technique(s) used to find the error and discover its cause will be the same. Note that error messages have been divided into two categories: those produced by the support system (e.g., compiler, operating system), and those designed into the code for the specific purposes of the project. Testing has also been divided into two categories: test runs made prior to acceptance testing (pre-acceptance test runs), and acceptance tests. If activities other than those listed in the table were used in finding the error or discovering its cause, check either in the appropriate column, and describe the activities used in Section E. This table inevitably has some redundancy: a check in column 2 must always have a corresponding check in column 1, similarly with columns 4 and 3.

What was the time used to isolate the cause?

Check the space that most closely approximates the time required to isolate the cause of the error. This should be the total of the time that was spent in the activities tried to find the cause. If the cause of the error was never found, and a workaround was used, check the appropriate box. If the cause was never found and a workaround was not used, explain the circumstances in Section E.

Was this error related to a previous change?

Changes to software may result in errors because of one or more of several reasons:

- the change was incorrectly implemented, i.e., did not conform to its specification;
- the change invalidated an assumption made elsewhere in the software;
- an assumption made about the rest of the software in the design of the change was incorrect.

An error is related to a previous change if it results from one of the above three conditions. Errors that are uncovered by changes, i.e., an error masked by another that is revealed when the latter is corrected, do not belong in this category. If the error is related to a previous change, give the number and date of the change report form of the related change. When did the error enter the system?

Check the box that most closely represents the phase in the erroneous components' development in which the error was introduced.

SECTION E—ADDITIONAL INFORMATION

This section is intended to permit further explanation of any items you feel may be significant in categorizing the change (including error corrections). If the "other" category was checked in any of the previous sections of the form, a fuller explanation should be given here. Do not hesitate to give a full description of the error or change or any doubts you may have in classifying it. The accuracy of our analysis is dependent on the amount and accuracy of the data you provide for us. The study we are performing is an attempt to do a careful, detailed investigation of the processes that go on during software development, the kinds of changes and errors that occur during development, and the reasons for their occurrence. With your help, we hope to gain enough insight into the design, coding, and testing of programs so that proposed techniques for coping with software changes and reducing the number of errors can be evaluated. Your cooperation and patience in completing the change report form each time you make a change to a document or program are needed and appreciated.

B.2 SEL GLOSSARY OF TERMS USED WITH DATA COLLECTION FORMS

This section defines the terms used in the software engineering data collection forms reproduced in Section B.1. A more extensive glossary (based substantially on this one) is found in Reference 9.

| | |
|-----------------------|--|
| assignment statements | All statements that change the value of a variable as their main purpose (e.g., assignment or READ statements, but the assignment of the DO loop variable in a DO statement should not be included). |
| attitude/orbit | Any component that is directly related to either the attitude determination (or control) task or to the orbit determination (or control) task falls into this category. This should include full systems in general (such as GTDS or ISEE-B Attitude) as well as specific modules such as Deterministic Attitude or DCCONES. |
| attribute list | A compiler-generated list of the identifiers used by a program that describes the characteristics of those identifiers and shows the source statements where they are first defined (or first used) and, for variables, their (relative) storage locations. |
| automated tools | Any programs whose purpose is to aid in software development (e.g., compiler, text editor, or dump or trace facility). This includes compilers but not standard operating system software (e.g., linkage editor). |
| baseline diagram | A structured chart listing all components in a system in which a connection from a higher component to a lower one indicates that the higher component calls the lower one. |
| batch | Use of a computer in which the entire job is read into the machine before the processing begins and in which there is no provision for interaction with the submitter during execution of the job. (Interactive usage is always via a terminal; batch usage may be via a terminal or a card deck.) |

| | |
|------------------------|---|
| bottom-up | The design (or implementation) of the system starting with the lowest level routines and proceeding to the higher level routines that use the lower levels. |
| business/ financial | The second of the four major categories applies to components related to some accounting task, financial data formatting, business data retrieval or reporting, or possibly personnel data management. Very few of the components being studied will fall into this class. |
| change | A modification to design, code, or documentation. A change might be made to correct an error, to improve system performance, to add capability, to improve appearance, or to implement a requirements change, for example. |
| clerical | The process of copying an item from one format to another or from one medium to another, which involves no interpretation or semantic translation. |
| code reading | Visual inspection of the source code by persons other than the creator of the code. |
| command/ control | This class of components includes those used either to generate vehicle commands or to transmit these commands from the control center. |
| complexity | Measures the difficulty of implementing a component, independent of the implementer's experience. Easy (or simple) means that any good programmer can write down the correct code with little thought. Hard (or complex) means that much thought is involved in the design. (Compare this with "precise"; e.g., easy and imprecise may mean a vague specification, but once the approach is decided upon, the code is easy to write.) |
| component | A piece of the system identified by name or common function (e.g., separately compilable function, an entry in a tree chart or baseline diagram for the system at any point in time, or a shared section of data such as a COMMON block). |

| | |
|--------------------|---|
| computer time | For batch usage, this is the billable time for all runs. For interactive usage, it is the number of hours spent at a terminal. |
| confidence level | Percentage probability that a given number is correct: 100 percent means that the number is absolute certainty; 0 percent means that the number must be incorrect. |
| constraints | Restrictions on resource availability (execution time, memory allocation) imposed by specifications. |
| constraints, space | All restrictions caused by space problems. On the Component Summary Report form, list each restriction separately (e.g., maximum number of words that component may occupy at one time or maximum disk space available during execution time or for program storage). |
| constraints, time | All restrictions caused by various machine and calendar time problems. On the Component Summary Report form, list each restriction separately (e.g., maximum execution time for component to process and respond to some input condition or time to complete a component or milestone). |
| control statements | All statements that potentially alter the sequence of executed instructions (e.g., GOTO, IF, RETURN, or DO). |
| correction | A change made to correct an error. |
| cosmetic | Changes in the source program that have little effect on the performance of program (e.g., correct comments, move code around as long as it does not alter the algorithm implemented, or change the name of a local variable). |
| create | The creation and recording of the idea. |
| creation date | Date that the component was first named (e.g., date it first appeared on a tree chart). |
| cross-reference | List of the identifiers used by a program showing (by means of indices or statement numbers) which statements of the program define and reference those identifiers. |

| | |
|--------------------------------------|---|
| data base applications | This category is to include components that retrieve, write to, or format information for a well-defined formatted bank of information available to the system. The user must decide whether or not the data set is to be considered a data base. An example of an acceptable data base would be the ADL file, SLP file, or Geodetics file, whereas a sequential telemetry file or tape would not be. |
| design | A description of what the system must do, its components, the interfaces among those components, and the system's interface(s) to the external environment. |
| design phase | The creation and recording of the design, including discussion about strategy with peers. This phase does not include the development of any code at the programming language level. It does include the creation of specifications for subcomponents of the current component. |
| design reading | Visual inspection of the design by persons other than the creator of the design. |
| development phase | The development and recording of code and inline comments based on the design. This phase includes the modification of code caused by design changes or errors found in testing. It does not include any time spent in entering the code into the computer. |
| documentation | Written material, other than source code statements, that describes a system or any of its components. |
| dump | Record of the state of the memory space used by a program at some point in its execution. A dump may include all or part of the program's memory space (including registers). |
| end date | Date that a project is scheduled to be completed. |
| English (or informal) specifications | Specifications given as readable English text, as opposed to some formal notation. |

| | |
|---|--|
| error | Discrepancy between a specification and its implementation. The specification might be requirements, design specifications, or coding specifications. |
| external environment | Combination of hardware and software used to maintain and execute the software, including the computer on which the software executes, the operating system for that computer, support libraries, text editors, and compilers. |
| formal specifications | Some specification technique based upon a strict set of rules for describing the specification and usually involving the use of an unambiguously defined notation (e.g., mathematical functions or formal PDL). |
| function | Mathematical notation used to specify the set of input, the set of output, and the relationship between input and output. |
| functional specifications | Specification of a component as a set of functions defining the output for any input. The specification emphasizes what the program is to do rather than how to do it. However, an algorithmic specification can be considered functional if it is not used to dictate the actual algorithm to be used. (See procedural specifications.) |
| hardest first | Design (or implementation) of the most difficult aspects of the system first. |
| HIPO (Hierarchical Input Process Output) | Graphical technique that defines each component by its transformation on its input data sets to its output data sets. |
| implementation | Implementation of a program is either a machine-executable form of the program or a form of the program that can be automatically translated (e.g., by compiler or assembler) into machine-executable form. |
| integration test | Test of several modules to check that the interfaces are defined correctly. |
| integration test, full | Test of the entire system (i.e., top-level component). |

| | |
|---------------------------|--|
| integration test, partial | Test of any set of modules but not the entire system. |
| intended use of | Result of invoking a program or segment of a program, including the actions performed by that program when invoked. Invocation may be by subroutine or function call or by a branch to a segment of code. |
| interface | Set of data passed between two or more programs or segments of programs and the assumptions made by each program about how the others operate. |
| interactive | Use of a computer via a terminal in which each line of input is immediately processed by the computer. |
| iterative enhancement | Design (or implementation) of successive versions, each producing a usable subset of the final product until the entire system is fully developed. |
| level | Unit corresponding to some partitioning of the final product (e.g., a single line of code, 10 lines of code, 25 lines of code, subroutine, or module). If the system is hierarchically structured, each component is at a higher level than its subcomponents, and the system may be described as the highest level component (the component at level 1), the component at level 2, or the lowest level component. |
| level, lowest | Smallest unit identified by the activity (e.g., code reading to the single statement, top-down design to the module level, or top-down design to level 3). |
| librarian | A clerk whose responsibilities include processing source statements but not writing them, (e.g., maintaining libraries, updating code, or producing tape backups). |
| machine words | Number of words in a main memory that a component occupies at one time. |
| manpower | Sum, over the number of people, of the number of hours per person charged to the contract. |

| | |
|----------------------------|---|
| mathematical/ numerical | This category is meant to be a more specific category than the scientific class. It contains those components that reflect a specific algebraic expression or mathematical algorithm. Such components as a dot product routine or a numerical integrator are in this category. |
| maximum space | Total number of machine words that the system may occupy at one time. |
| mission date | Date that system must be operational. |
| module test | Test of a single module. |
| none used | No explicit technique was specified to be used. |
| onboard processing | All components that are built for the purpose of satisfying some onboard processing need belong to this class. Although the component may be built and tested on a computer that is not the real flight computer, it should be classified as onboard if the final destination is the OBC (onboard computer). |
| optimization | Changes in the source code to improve program performance (e.g., run faster or use less space). Optimization changes are not error corrections; however, if a change is made to use less space to conform to the specified space constraint, then the term "error" applies. |
| PDL | Program design language (often called pseudocode). Used in the design and coding phases of a project, PDL is a language that contains a fixed set of control statements and a formal or informal way of defining and operating on data structures. PDL code may or may not be machine-readable, and for this study it is not considered as documentation, but as an integral part of the finished source program. |

| | |
|---------------------------|--|
| procedural specifications | Specification of a component in some algorithmic manner (e.g., using PDL or a flowchart). The specification says how the program is to work. (See functional specifications.) |
| proof technique | Method for formally demonstrating that a piece of software performs according to its specifications. Proof techniques usually use some form of mathematical notation to describe the result of executing a program. |
| range in module size | Number of source statements in a module, including comments. |
| read | The reading by peers of the recordings of the current phase to look for errors, invent tests, and so on. |
| real-time | This class includes components that are a direct function of events occurring at, or near, the current time. Typical components would be the Attitude Control Monitors. Since parts of most of the telemetry processors are required to process data as it is received, they too may be considered real-time components. |
| requirements | System specification written by the user to define a system to a developer. The developer uses these specifications in designing, implementing, and testing the system. |
| review | Formal meeting of several individuals for the purpose of explaining design (management review). Also includes the time spent in preparing for the review. All those attending a review should list the components discussed in their own Component Summary Report for that week. |
| scientific | A component may be in this category if it is related to some mathematical algorithm, engineering problem, law of physics, or celestial mechanics problem. Most of the full systems developed will fall into this category, whereas the various pieces of modules may fall into some of the other classes. |

| | |
|---------------------------------|---|
| segment | Contiguous piece of code that is unnamed and, hence, cannot be referred to as a single entity in a program statement. A segment could be one or several lines of a subroutine, part of a data area, or an arbitrary contiguous section of memory. |
| shared items | Data and programs, accessible by several components, such as COMMON blocks, external files, and library subroutines. |
| simulating constructs | Statements that are used to simulate structured control structures when the language to be used does not contain structured control structures. |
| source instructions | See source statements. |
| source statements | All statements readable by and read by the compiler. This includes executable statements (e.g., assignment, IF, and GO TO); nonexecutable statements (e.g., DIMENSION, REAL, and END); and comments. |
| specification | Description of the input, output, and essential function(s) to be performed by a component of the system. The specification is produced by the organization that is to develop the system; that is, at the top level, it can be thought of as the contractor's interpretation of the requirements. |
| specification, imprecise | The input, output, and function of the component are loosely defined. Much of what is required is assumed rather than specified. The specification relies heavily on programmer experience and verbal communication to get an unambiguous interpretation and a full understanding of what is needed. |
| specification, precise | The input, output, and function of the component are well defined. There are underlying assumptions not specified, but it is assumed that any programmer working on the project, with experience on a similar project, will understand these assumptions. It is possible to arrive at an ambiguous interpretation or misunderstanding |

| | |
|---------------------------------------|--|
| specification, precise (Cont'd) | of the specifications if the reader does not have enough experience with the problem or does not obtain further verbal communication. |
| specification, very precise | Completely defined description of the input, output, and function of a component. The implementer of a very precise specification need make few, if any, assumptions. It is almost impossible to arrive at an ambiguous interpretation or misunderstanding of the specifications. |
| specification-driven | Using the specifications of the program to determine test data (e.g., test data is generated by examining the input/output requirements and specifications). |
| standards | Any specifications that refer to the method of development of the source program itself, and not to the problem to be implemented (e.g., using structured code, at most 100-line subroutines, or all names prefixed with subsystem name). |
| start date | Date on which initial work on a project began. |
| string processing | This includes components that perform operations on lists of characters. Normally, this class is assumed to include functions of compilers, hash code string hook-up, and array comparisons. |
| structure-driven | Using the structure of the program to determine test data (e.g., generating data to ensure that each branch of a program is executed at least once). |
| structure of data | Organization of a composite data item consisting of several variables or other array items. Examples of such composite data items are arrays (both singly- and multiply-dimensioned), strings, complex variables and constants, records on a disk file (each record containing several words), and multiple-word entries in a table. |
| structured code | The language supports structured control structures (e.g., a FORTRAN preprocessor). |

| | |
|--------------------------------|---|
| systems | By system-related software, one includes any package designed to affect, modify, extend, or change the normal available processing procedure of the operating system. This could include such components as error tracing or extended I/O such as DAIO. |
| system size | Total number of machine words needed for all instructions generated on the project plus space for data, library routines, and other code. This is the total size of the system without using any overlay structure. |
| table handler | Includes components that are specifically designed to generate or interpret information in a table format such as the Generalized Telemetry Processor. |
| telemetry/ tracking | Includes all components that are specifically required to interface (either read, write, or format) with telemetry or tracking data. |
| testing phase | Design of tests, testing strategies, and the running of such tests. This phase does not include the writing of any code (even for debugging purposes), which should be recorded under coding. |
| top-down | Design (or implementation) of the system, starting with a single component, one level at a time, by expanding each component reference as an algorithm possibly calling other new components. |
| trace | Record of program execution showing the sequence of subroutine and function calls and, sometimes, the value of selected variables. Code used in producing a trace is automatically inserted into a program, usually by the compiler, sometimes by other support software. |
| type of software | The four major classifications of most of the applicable software being developed are: scientific, business/financial, systems, and utility. These classifications may be refined into the categories of: string processing, data base applications, real-time, and table |

| | |
|------------------------------|--|
| type of software (Cont'd) | handler. A further refinement includes the categories of: attitude/orbit, telemetry/tracking, command/control, mathematical, and numerical onboard. |
| utility | Any component that is generated to satisfy some general support function required by other applications software may be considered a utility. This class of components usually contains software that does not fit into any of the other three categories. Although components can fall into two of the primary categories (e.g., scientific and utility), it will be easier to use only the more descriptive of the categories (e.g., vector cross-product--scientific; data unpacking--utility). |
| value of data | The number and kind of number (e.g., integer, floating-point, or ASCII-encoded character) stored in a local variable or data area, parameter, common variable, or system-wide data item. |
| walkthrough | Formal meeting sessions for the review of source code and design by the various members of the project for technical rather than management purposes. The purpose is for error detection and not correction. |
| workaround | The method used to counteract the effects of an error in a program when the cause of the error and, consequently, the location of the statements containing the error is not known or is inaccessible (e.g., a compiler error). |

APPENDIX C - ABBREVIATIONS

The following are explanations of abbreviations used throughout this document.

| | |
|---------|---|
| ACC | Accounting Information File |
| ATM | Attitude Maintenance Change Report File |
| CIF | Component Information File |
| CMT | Comment File |
| CRF | Change Report Form |
| CSC | Computer Sciences Corporation |
| CSF | Component Summary Form |
| CSR | Component Status Report |
| DBI: | Disk DBI |
| DBAM | Data Base Maintenance Software |
| DEC | Digital Equipment Corporation |
| DIR | • Subjective Evaluations Directory File |
| ENC | Encoding Dictionary |
| GPS | General Project Summary |
| GSFC | Goddard Space Flight Center |
| HDR | Phase Dates File |
| HIPO | Hierarchical Input Processing Output |
| HIS | Growth History File |
| JCL | Job Control Language |
| PDL | Program Design Language |
| RAF | Run Analysis Form |
| RJE | Remote Job Entry |
| RJP | Remote Job Processing |
| RMS | Record Management System |
| RMSIAC | RMS Indexed Access routines |
| RSF | Resource Summary Form |
| RSX-11M | Current PDP-11/70 Operating System |
| SAP | FORTTRAN Source Analyzer Program |
| SEF | Subjective Evaluations File |
| TSO | Timesharing Option (IBM) |

UIC User Identification Code
UM University of Maryland
YYMMDD Year-Year-Month-Month-Day-Day date format.
 For example, 810704 is July 4, 1981.
[n,m] User Identification Code. For example, [204,1]

APPENDIX D - USER IDENTIFICATION CODE (UIC) LAYOUT

This appendix lists the organization of all production software located under the User Identification Code (UIC) of 204 on disk DB1.

1. [204,1]--All data base files.
2. [204,2]--Not used.
3. [204,3]--Indirect command files for DBAM or tape delivery, plus temporary intermediate files used by DBAM.
4. [204,4]--Indirect files for reports and other utility programs.
5. [204,5]--All task images. Help files associated with each task image.
6. [204,6]--Source code and object modules for all task images except DBAM. Command and overlay files to create task images. Fixed input data files to programs.
7. [204,7]--Utility source code and object modules used by several programs (e.g., generalized open and read routines).
8. [204,10]--DATATRIEVE record and domain-definition indirect files.
9. [204,11]--Profile reports and all reports produced.
10. [204,12]--Tape backup command files.
11. [204,15]--DBAM source code and object modules, plus task generation command files and overlay files.

BIBLIOGRAPHY OF SEL LITERATURE

The technical papers, memorandums, and documents listed in this bibliography are organized into two groups. The first group is composed of documents issued by the Software Engineering Laboratory (SEL) during its research and development activities. The second group includes materials that were published elsewhere but pertain to SEL activities.

SEL-Originated Documents
